# TEST REPORT

Reference No. .... : WTF22X12246930W001

Manufacturer ..... : Mid Ocean Brands B.V.

Address ..... : 7/F., Kings Tower, 111 King Lam Street, Cheung Sha Wan, Kowloon, Hong Kong

Factory ..... : 118102

Product Name ..... : wireless power bank speaker

Model No. .... : MO6887

Standards ..... : ETSI EN 300 328 V2.2.2 (2019-07)

Date of Receipt sample .... : 2022-12-07

Date of Test ..... : 2022-12-07 to 2023-03-07

Date of Issue ..... : 2023-03-07

Test Report Form No. .... : WTX\_ ETSI EN 300 328\_2019W

Test Result ..... : Pass

Remarks:

The results shown in this test report refer only to the sample(s) tested, this test report cannot be reproduced, except in full, without prior written permission of the company. The report would be invalid without specific stamp of test institute and the signatures of approver.

## 1. GENERAL INFORMATION

### 1.1 Product Description for Equipment Under Test (EUT)

<b>General Description of EUT</b>	
Product Name:	wireless power bank speaker
Trade Name:	/
Model No.:	MO6887
Adding Model(s):	/
Rated Voltage:	Battery DC 3.7V
Battery Capacity:	4000mAh
Adapter Model:	/
Software Version:	V1.0
Hardware Version:	V1.2
Radio Technology:	Bluetooth V5.1(EDR Mode)
Operation Frequency:	2402MHz-2480MHz
Modulation:	GFSK, π/4 DQPSK, 8DPSK
Antenna Type:	PCB Antenna
Antenna Gain:	-0.58dBi
<p><i>Note: The Antenna Gain is provided by the customer and can affect the validity of results.</i></p> <p><i>The test data is gathered from a production sample, provided by the manufacturer.</i></p>	

<b>E.1 Product Information (Bluetooth V5.1)</b>	
a) Type of modulation:	<input checked="" type="checkbox"/> FHSS <input type="checkbox"/> other forms of modulation
b) In case of FHSS modulation:	
Max. No. of hopping freq.:	79 CH
Min. No. of hopping freq.:	15 CH
Accumulated Dwell time:	321.9ms
Frequency Occupation(Burst Number)	3
c) Adaptive / non-adaptive:	adaptive equipment without a non-adaptive mode
d) In case of adaptive equipment:	The equipment has implemented an LBT based DAA mechanism
e) In case of non-adaptive equipment:	No
f) The worst case operational mode for each of the following tests:	
RF output power	DH5
Accumulated dwell time	DH5
Minimum frequency occupation	DH5
Occupied channel bandwidth	DH5, 3DH5 (Min, Max)

Transmitter unwanted emissions in the OOB domain	DH5
Transmitter unwanted emissions in the spurious domain	DH5
Receiver spurious emissions	DH5
<b>g)</b> Operating mode(antenna):	Single Antenna Equipment
<b>h)</b> In case of smart antenna systems:	No
<b>i)</b> Operating frequency range(s) of the equipment:	2402 MHz to 2480 MHz
<b>j)</b> Occupied channel bandwidth(s):	Bandwidth 1(Min): 0.84MHz Bandwidth 2(Max): 1.17MHz
<b>k)</b> Type of equipment:	<input checked="" type="checkbox"/> Stand-alone <input type="checkbox"/> Combined equipment <input type="checkbox"/> Plug-in device
<b>l)</b> The extreme operating conditions	
Extreme voltage range:	Please refer to Section 1.5
Extreme temperature range:	Please refer to Section 1.5
<b>m)</b> The intended combination(s) of the radio equipment power settings and one or more antenna assemblies and their corresponding e.i.r.p levels:	
Antenna type:	<input checked="" type="checkbox"/> PCB Antenna <input type="checkbox"/> Dedicated Antennas
Antenna Gain:	-0.58dBi
<b>n)</b> Nominal voltage:	Please refer to Section 1.5
<b>o)</b> Describe the test modes available which can facilitate testing:	Please refer to Section 1.5
<b>p)</b> The equipment type	Bluetooth
<b>E.2 Power Level Setting</b>	
Highest EIRP value:	0.93dBm
Conducted power:	1.51dBm
Listed as power setting:	Default
<b>E.3 Additional Information</b>	
Modulation:	GFSK, π/4 DQPSK, 8DPSK
Unmodulated modes:	No
Duty cycle:	Continuous operation possible for testing purposes
Type of the UUT:	Production models
Supporting equipment:	Combined equipment

## 1.2 Test Standards

The tests were performed according to following standards:

**ETSI EN 300 328 V2.2.2 (2019-07)**: Wideband transmission systems; Data transmission equipment operating in the 2.4 GHz band; Harmonised Standard for access to radio spectrum.

**Maintenance of compliance** is the responsibility of the manufacturer. Any modification of the product maybe which result in lowering the emission/immunity should be checked to ensure compliance has been maintained.

## 1.3 Test Methodology

All measurements contained in this report were conducted with ETSI EN 300328, the equipment under test (EUT) was configured to measure its highest possible emission level. For more detail refer to the Operating Instructions.

## 1.4 Test Facility

### Address of the test laboratory

Laboratory: Waltek Testing Group (Shenzhen) Co., Ltd.

Address: 1/F., Room 101, Building 1, Hongwei Industrial Park, Liuxian 2nd Road, Block 70 Bao'an District, Shenzhen, Guangdong, China

### FCC – Registration No.: 125990

Waltek Testing Group (Shenzhen) Co., Ltd. EMC Laboratory has been registered and fully described in a report filed with the FCC (Federal Communications Commission). The acceptance letter from the FCC is maintained in our files. The Designation Number is CN5010, and Test Firm Registration Number is 125990.

### Industry Canada (IC) Registration No.: 11464A

The 3m Semi-anechoic chamber of Waltek Testing Group (Shenzhen) Co., Ltd. has been registered by Certification and Engineering Bureau of Industry Canada for radio equipment testing with Registration No.: 11464A.

## 1.5 EUT Setup and Test Mode

The equipment under test (EUT) was configured to measure its highest possible emission/immunity level. The test modes were adapted according to the operation manual for use, the EUT was operated in the engineering mode to fix the Tx/Rx frequency that was for the purpose of the measurements, more detailed description as follows:

### Test Mode List

Test Mode	Description	Remark
TM1	EDR	2402/2441/2480MHz
TM2	Hopping	2402-2480MHz

	NTNV	LTVN	HTNV
Temperature (°C)	20	-10	40
Voltage (V)	3.7		
Relative Humidity:			45 %.
ATM Pressure:			1019 mbar

### EUT Cable List and Details

Cable Description	Length (m)	Shielded/Unshielded	With / Without Ferrite
USB Cable	1.03	Unshielded	Without Ferrite

## 1.6 Measurement Uncertainty

Measurement uncertainty		
Parameter	Uncertainty	Note
Radio frequency	$\pm 0.4 \text{ ppm}$	(1)
Conducted RF Output Power	$\pm 0.42 \text{ dB}$	(1)
Occupied Bandwidth	$\pm 1 \times 10^{-7}$	(1)
Conducted Power Spectral Density	$\pm 0.70 \text{ dB}$	(1)
Conducted Spurious Emission	$\pm 2.17 \text{ dB}$	(1)
Radiated Spurious Emissions	30-200MHz $\pm 4.52 \text{ dB}$	(1)
	0.2-1GHz $\pm 5.56 \text{ dB}$	(1)
	1-6GHz $\pm 3.84 \text{ dB}$	(1)
	6-18GHz $\pm 3.92 \text{ dB}$	(1)

(1) This uncertainty represents an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of  $k=1.96$ .

## 1.7 Test Equipment List and Details

Description	Manufacturer	Model	Serial Number	Cal Date	Due Date

## 2. SUMMARY OF TEST RESULTS

Standards	Reference	Description of Test Item	Result
EN 300 328	4.3.1.2 / 4.3.2.2	RF Output Power	Passed
	4.3.2.3	Power Spectral Density	N/A
	4.3.1.3 / 4.3.2.4	Duty Cycle, Tx-sequence, Tx-gap	N/A
	4.3.1.4	Accumulated Transmit Time, Frequency Occupation and Hopping Sequence	Passed
	4.3.1.5	Hopping Frequency Separation	Passed
	4.3.1.6 / 4.3.2.5	Medium Utilisation (MU) Factor	N/A
	4.3.1.7 / 4.3.2.6	Adaptivity (Adaptive Frequency Hopping)	N/A
	4.3.1.8 / 4.3.2.7	Occupied Channel Bandwidth	Passed
	4.3.1.9 / 4.3.2.8	Transmitter Unwanted Emissions in the Out-of-band Domain	Passed
	4.3.1.10 / 4.3.2.9	Transmitter Unwanted Emissions in the Spurious Domain	Passed
	4.3.1.11 / 4.3.2.10	Receiver Spurious Emissions	Passed
	4.3.1.12 / 4.3.2.11	Receiver Blocking	Passed
	4.3.1.13 / 4.3.2.12	Geo-location capability	N/A

Passed: The EUT complies with the essential requirements in the standard.

Failed: The EUT does not comply with the essential requirements in the standard.

N/A: Not applicable.

## 3. RF Output Power

### 3.1 Standard Applicable

According to Section 4.3.1.2.3, the maximum RF output power for adaptive Frequency Hopping equipment shall be equal to or less than 20 dBm. The maximum RF output power for non-adaptive Frequency Hopping equipment, shall be declared by the supplier. The maximum RF output power for this equipment shall be equal to or less than the value declared by the supplier. This declared value shall be equal to or less than 20 dBm.

According to Section 4.3.2.2.3, for adaptive equipment using wide band modulations other than FHSS, the maximum RF output power shall be 20 dBm. The maximum RF output power for non-adaptive equipment shall be declared by the supplier and shall not exceed 20 dBm. For non-adaptive equipment using wide band modulations other than FHSS, the maximum RF output power shall be equal to or less than the value declared by the supplier.

This limit shall apply for any combination of power level and intended antenna assembly.

### 3.2 Test Procedure

According to section 5.4.2.2.1.2 of the standard EN 300328, the test procedure shall be as follows:

#### Step 1:

- Use a fast power sensor suitable for 2,4 GHz and capable of 1 MS/s.
- Use the following settings: - Sample speed 1 MS/s or faster.
  - The samples must represent the power of the signal.
  - Measurement duration: For non-adaptive equipment: equal to the observation period defined in clauses 4.3.1.3.2 or clause 4.3.2.4.2. For adaptive equipment, the measurement duration shall be long enough to ensure a minimum number of bursts (at least 10) are captured.

NOTE 1: For adaptive equipment, to increase the measurement accuracy, a higher number of bursts may be used.

#### Step 2:

- For conducted measurements on devices with one transmit chain:
  - Connect the power sensor to the transmit port, sample the transmit signal and store the raw data. Use these stored samples in all following steps.
- For conducted measurements on devices with multiple transmit chains:
  - Connect one power sensor to each transmit port for a synchronous measurement on all transmit ports.
  - Trigger the power sensors so that they start sampling at the same time. Make sure the time difference between the samples of all sensors is less than half the time between two samples.
  - For each individual sampling point (time domain), sum the coincident power samples of all ports and store them. Use these summed samples in all following steps..

**Step 3:**

- Find the start and stop times of each burst in the stored measurement samples.

The start and stop times are defined as the points where the power is at least 30 dB below the highest value of the stored samples in step 2.

NOTE 2: In case of insufficient dynamic range, the value of 30 dB may need to be reduced appropriately.

**Step 4:**

- Between the start and stop times of each individual burst calculate the RMS power over the burst using the formula below. Save these Pburst values, as well as the start and stop times for each burst.

$$P_{burst} = \frac{1}{k} \sum_{n=1}^k P_{sample}(n)$$

with 'k' being the total number of samples and 'n' the actual sample number

**Step 5:**

- The highest of all Pburst values (value "A" in dBm) will be used for maximum e.i.r.p. calculations.

**Step 6:**

- Add the (stated) antenna assembly gain "G" in dBi of the individual antenna.
- If applicable, add the additional beamforming gain "Y" in dB.
- If more than one antenna assembly is intended for this power setting, the maximum overall antenna gain (G or G + Y) shall be used.
- The RF Output Power (P) shall be calculated using the formula below:  $P = A + G + Y$
- This value, which shall comply with the limit given in clause 4.3.1.2.3 or clause 4.3.2.2.3, shall be recorded in the test report.

### 3.3 Summary of Test Results

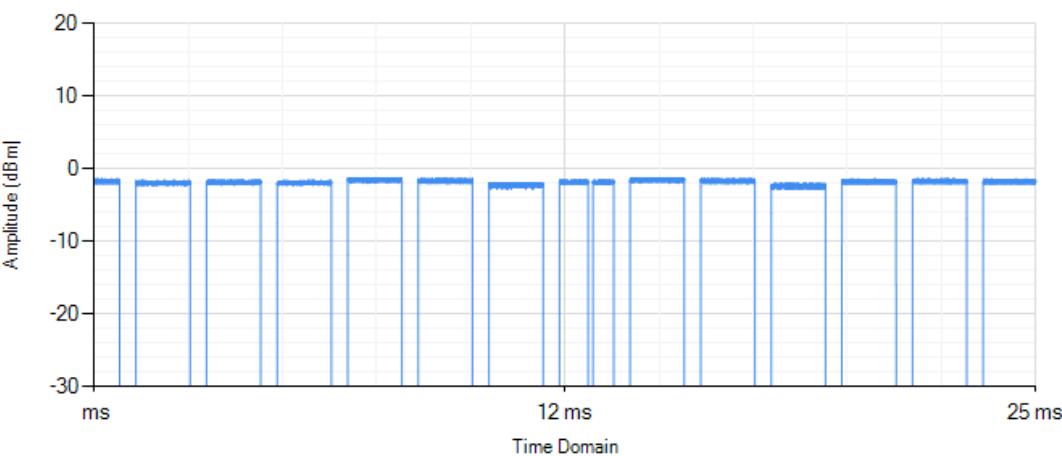

BR/EDR				
Test conditions	Modulation	EIRP (dBm)	Limit (dBm)	Result
NTNV	GFSK	-2.11	20.00	Pass
	$\pi/4$ DQPSK	-1.33		
	8DPSK	0.93		
LTNV	GFSK	-2.17	20.00	Pass
	$\pi/4$ DQPSK	-1.36		
	8DPSK	-0.98		
HTNV	GFSK	-2.14	20.00	Pass
	$\pi/4$ DQPSK	-1.34		
	8DPSK	-0.95

### 8DPSK 3DH5

#### RF Output Power

## 4. Accumulated Transmit Time, Frequency Occupation and Hopping Sequence

---

### 4.1 Standard Application

According to section 4.3.1.4.3,

Adaptive Frequency Hopping equipment shall be capable of operating over a minimum of 70 % of the band specified in clause 1.

The Accumulated Transmit Time on any hopping frequency shall not be greater than 400 ms within any observation period of 400 ms multiplied by the minimum number of hopping frequencies (N) that have to be used.

In order for the equipment to comply with the Frequency Occupation requirement, it shall meet either of the following two options:

Option 1: Each hopping frequency of the hopping sequence shall be occupied at least once within a period not exceeding four times the product of the dwell time and the number of hopping frequencies in use.

Option 2: The occupation probability for each frequency shall be between  $((1 / U) \times 25\%)$  and 77 % where U is the number of hopping frequencies in use.

The hopping sequence(s) shall contain at least N hopping frequencies at all times, where N is 15 or 15 divided by the minimum Hopping Frequency Separation in MHz, whichever is the greater.

### 4.2 Test procedure

According to section 5.4.4.2.1, the test procedure shall be as follows:

#### Step 1:

- The output of the transmitter shall be connected to a spectrum analyzer or equivalent.
- The analyzer shall be set as follows:
  - Centre Frequency: Equal to the hopping frequency being investigated
  - Frequency Span: 0 Hz
  - RBW: ~ 50 % of the Occupied Channel Bandwidth
  - VBW:  $\geq$  RBW
  - Detector Mode: RMS
  - Sweep time: Equal to the applicable observation period (see clause 4.3.1.4.3.1 or clause 4.3.1.4.3.2)
  - Number of sweep points: 30 000
  - Trace mode: Clear / Write
  - Trigger: Free Run

#### Step 2:

- Save the trace data to a file for further analysis by a computing device using an appropriate software application or program.

**Step 3:**

- Identify the data points related to the frequency being investigated by applying a threshold.

The data points resulting from transmissions on the hopping frequency being investigated are assumed to have much higher levels compared to data points resulting from transmissions on adjacent hopping frequencies. If a clear determination between these transmissions is not possible, the RBW in step 1 shall be further reduced. In addition, a channel filter may be used.

- Count the number of data points identified as resulting from transmissions on the frequency being investigated and multiply this number by the time difference between two consecutive data points.

**Step 4:**

- The result in step 3 is the accumulated Dwell Time which shall comply with the limit provided in clauses 4.3.1.4.3.1 or 4.3.1.4.3.2 and which shall be recorded in the test report.

**Step 5:**

NOTE 1: This step is only applicable for equipment implementing Option 1 in clause 4.3.1.4.3.1 or clause 4.3.1.4.3.2 for complying with the Frequency Occupation requirement and the manufacturer decides to demonstrate compliance with this requirement via measurement.

- Make the following changes on the analyser and repeat step 2 and step 3.

Sweep time:  $4 \times \text{Dwell Time} \times \text{Actual number of hopping frequencies in use}$

The hopping frequencies occupied by the equipment without having transmissions during the dwell time (blacklisted frequencies) should be taken into account in the actual number of hopping frequencies in use. If this number cannot be determined (number of blacklisted frequencies unknown) it shall be assumed that the equipment uses the maximum possible number of hopping frequencies.

- The result shall be compared to the limit for the Frequency Occupation defined in clause 4.3.1.4.3.1 or clause 4.3.1.4.3.2. The result of this comparison shall be recorded in the test report.

**Step 6:**

- Make the following changes on the analyzer:

- Start Frequency: 2 400MHz
- Stop Frequency: 2 483.5MHz
- RBW: ~ 50 % of the Occupied Channel Bandwidth (single hopping frequency)
- VBW:  $\geq$  RBW
- Detector Mode: RMS
- Sweep time: 1s
- Trace Mode: Max Hold
- Trigger: Free Run

NOTE 2: The above sweep time setting may result in long measuring times. To avoid such long measuring times, an FFT analyser could be used.

- Wait for the trace to stabilize. Identify the number of hopping frequencies used by the hopping sequence.
- The result shall be compared to the limit (value N) defined in clause 4.3.1.4.3.1 or clause 4.3.1.4.3.2. This value shall be recorded in the test report. For equipment with blacklisted frequencies, it might not be possible

to verify the number of hopping frequencies in use. However they shall comply with the requirement for Accumulated Transmit Time and Frequency Occupation assuming the minimum number of hopping frequencies (N) defined in clause 4.3.1.4.3.1 or clause 4.3.1.4.3.2 is used.

#### **Step 7:**

- For adaptive systems, using the lowest and highest -20 dB points from the total spectrum envelope obtained in step 6, it shall be verified whether the system uses 70 % of the band specified in clause 1. The result shall be recorded in the test report.

RBW/RBW=500/500kHz

#### **4.3 Summary of Test Results/Plots**

<b>Modulation</b>	<b>Test Channel</b>	<b>Packet</b>	<b>Maximum Accumulated Dwell Time</b>	
			<b>Acc. Dwell Time</b>	<b>Limit</b>
			<b>ms</b>	<b>ms</b>
GFSK	2402MHz	DH5	287.099	<400
	2480MHz	DH5	321.9	<400

Test Period: 400ms X Minimum number of hopping frequencies (N)  
 Accumulated Dwell Time = Time slot length (Dwell time) X Number of data points within a test period  
 Note: Test data is corrected with the worst case, which the packet length is GFSK DH5

<b>Modulation</b>	<b>Test Channel</b>	<b>Packet</b>	<b>Frequency Occupation requirement</b>	
			<b>Burst Number</b>	<b>Limit(Burst Number)</b>

## 5. Hopping Frequency Separation

### 5.1 Standard Application

According to section 4.3.1.5.3, for adaptive Frequency Hopping equipment, the minimum Hopping Frequency Separation shall be 100 kHz.

Adaptive Frequency Hopping equipment, which for one or more hopping frequencies, has switched to a non-adaptive mode because interference was detected on all these hopping positions with a level above the threshold level defined in clause 4.3.1.7.2.2 or clause 4.3.1.7.3.2, is allowed to continue to operate with a minimum Hopping Frequency Separation of 100kHz on these hopping frequencies as long as the interference is present on these frequencies. The equipment shall continue to operate in an adaptive mode on other hopping frequencies.

Adaptive Frequency Hopping equipment which decided to operate in a non-adaptive mode on one or more hopping frequencies without the presence of interference, shall comply with the limit in clause 4.3.1.5.3.1 for these hopping frequencies as well as with all other requirements applicable to non-adaptive frequency hopping equipment.

### 5.2 Test procedure

According to the section 5.4.5.2.1, the option 2 test method shall be used.

#### Step 1:

The output of the transmitter shall be connected to a spectrum analyzer or equivalent.

The analyzer shall be set as follows:

- Centre Frequency: Centre of the two adjacent hopping frequencies
- Frequency Span: Sufficient to see the complete power envelope of both hopping frequencies
- RBW: 1 % of the Span
- VBW:  $3 \times$  RBW
- Detector Mode: RMS
- Trace Mode: Max Hold
- Sweep Time: 1s

NOTE: Depending on the nature of the signal (modulation), it might be required to use a much longer sweep time, e.g. in case switching transients are present in the signals to be investigated.

#### Step 2:

- Wait for the trace to stabilize.
- Use the marker-delta function to determine the Hopping Frequency Separation between the centres of the two adjacent hopping frequencies (e.g. by identifying peaks or notches at the centre of the power envelope for the two adjacent signals). This value shall be compared with the limits defined in clause 4.3.1.5.3 and shall be recorded in the test report.

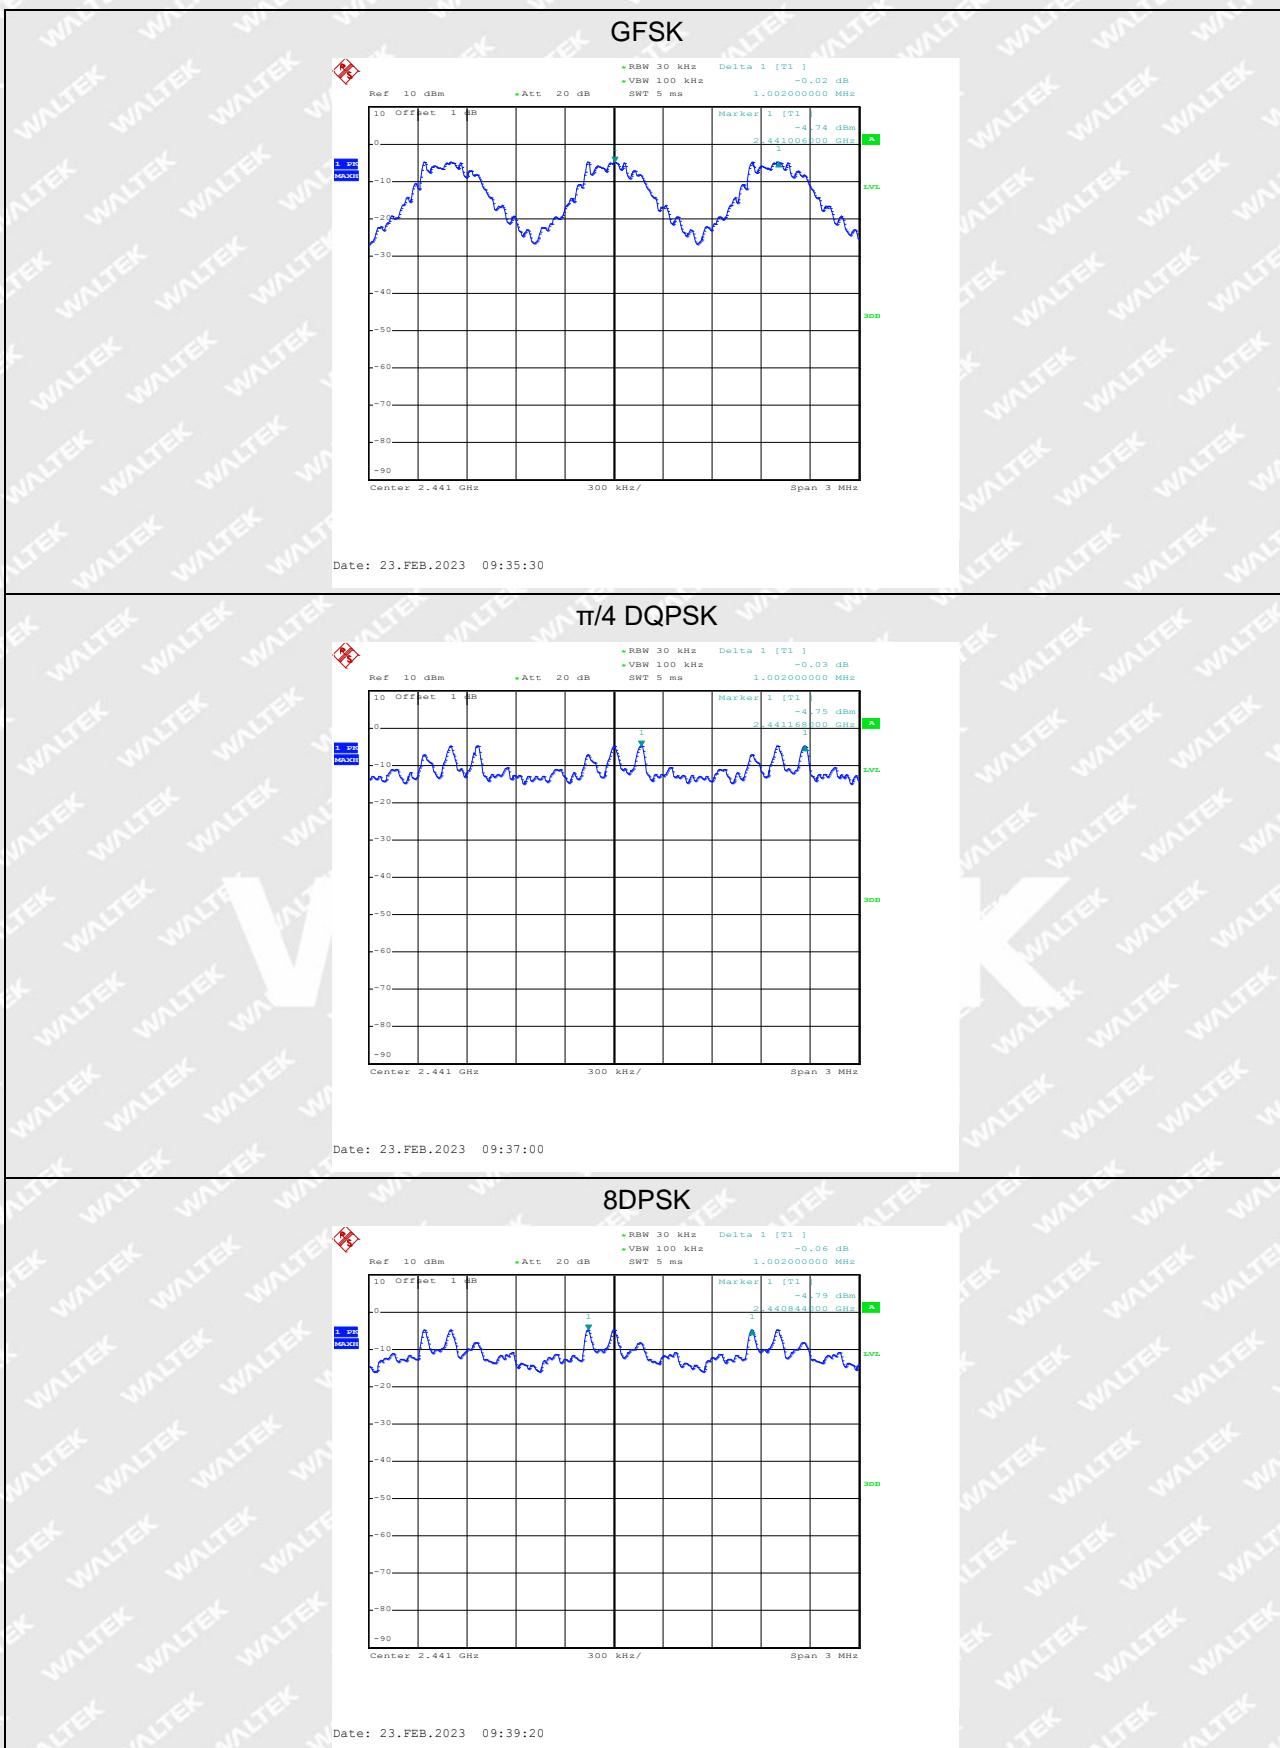

RBW/VBW=30/100kHz

### 5.3 Summary of Test Results/Plots

Test Mode	Channel Separation		Limit
	MHz	MHz	
GFSK	1.002		>0.1
$\pi/4$ DQPSK	1.002		>0.1
8DPSK	1.002		>0.1

**WALTEK**

## 6. Occupied Channel Bandwidth

### 6.1 Standard Application

According to section 4.3.1.8.3, the Occupied Channel Bandwidth for each hopping frequency shall fall completely within the band given in clause 1.

For non-adaptive Frequency Hopping equipment with e.i.r.p greater than 10 dBm, the Occupied Channel Bandwidth for every occupied hopping frequency shall be equal to or less than the value declared by the supplier. This declared value shall not be greater than 5MHz.

According to section 4.3.2.7.3, the Occupied Channel Bandwidth shall fall completely within the band given in clause 1. In addition, for non-adaptive systems using wide band modulations other than FHSS and with e.i.r.p greater than 10 dBm, the occupied channel bandwidth shall be less than 20 MHz.

### 6.2 Test procedure

According to the section 5.4.7.2.1, the measurement procedure shall be as follows:

#### Step 1:

Connect the UUT to the spectrum analyser and use the following settings:

- Centre Frequency: The centre frequency of the channel under test
- Resolution BW: ~ 1 % of the span without going below 1 %
- Video BW:  $3 \times$  RBW
- Frequency Span for frequency hopping equipment: Lowest frequency separation that is used within the hopping sequence
- Frequency Span for other types of equipment:  $2 \times$  Nominal Channel Bandwidth (e.g. 40 MHz for a 20 MHz channel)
- Detector Mode: RMS
- Trace Mode: Max Hold
- Sweep time: 1 s

#### Step 2:

Wait until the trace is completed.

Find the peak value of the trace and place the analyser marker on this peak.

#### Step 3:

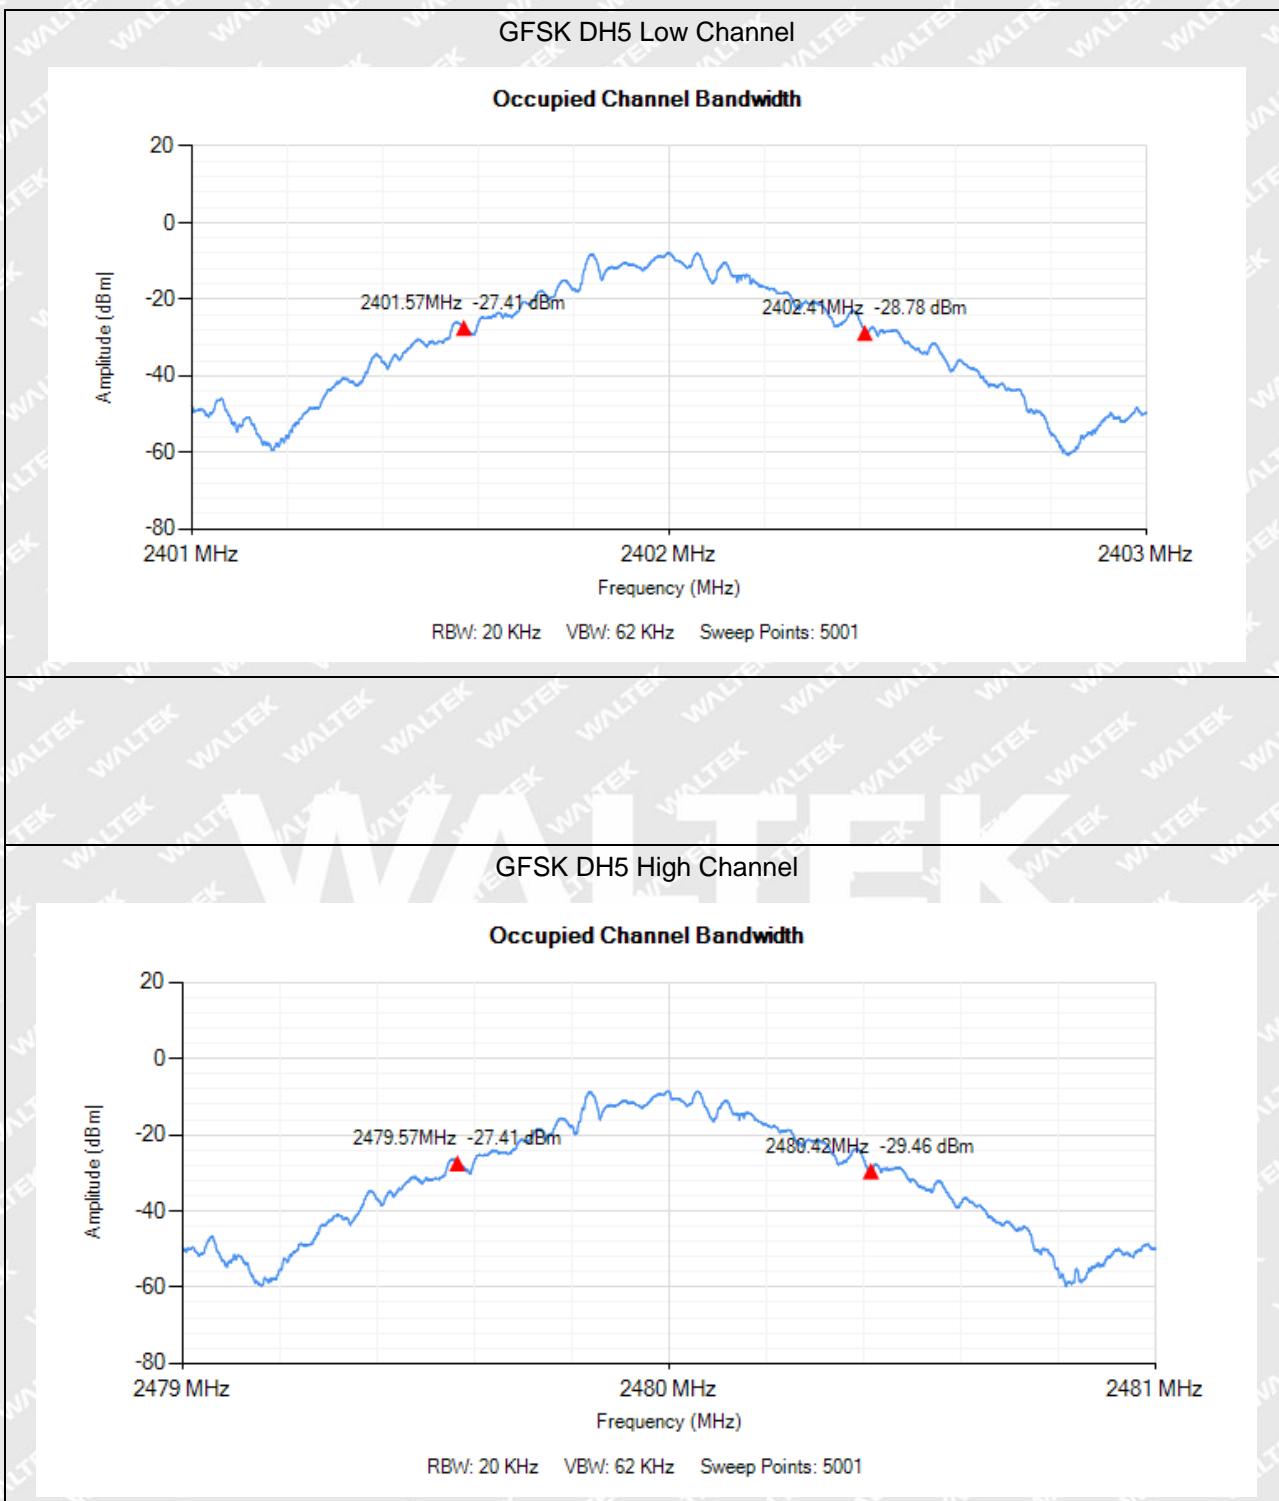

Use the 99 % bandwidth function of the spectrum analyser to measure the Occupied Channel Bandwidth of the UUT. This value shall be recorded.

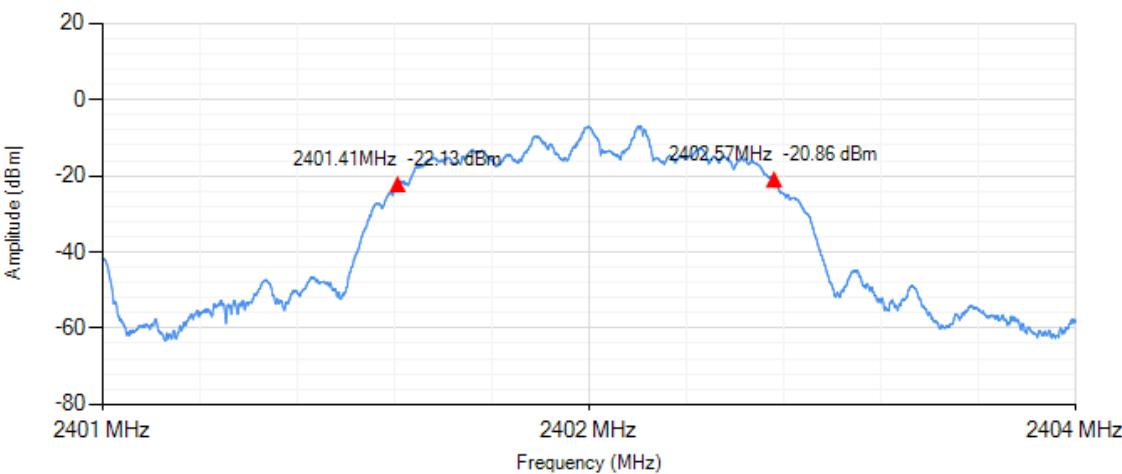

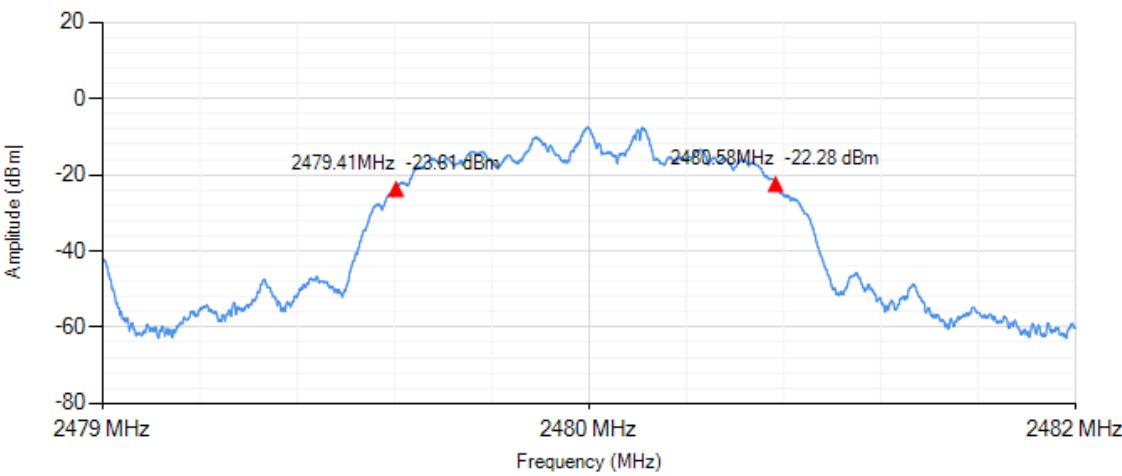

### 6.3 Summary of Test Results/Plots

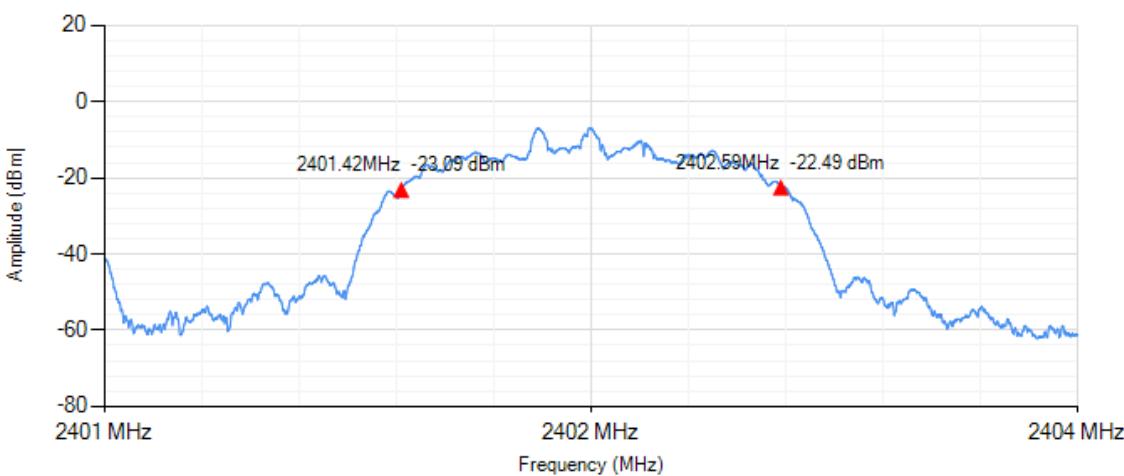

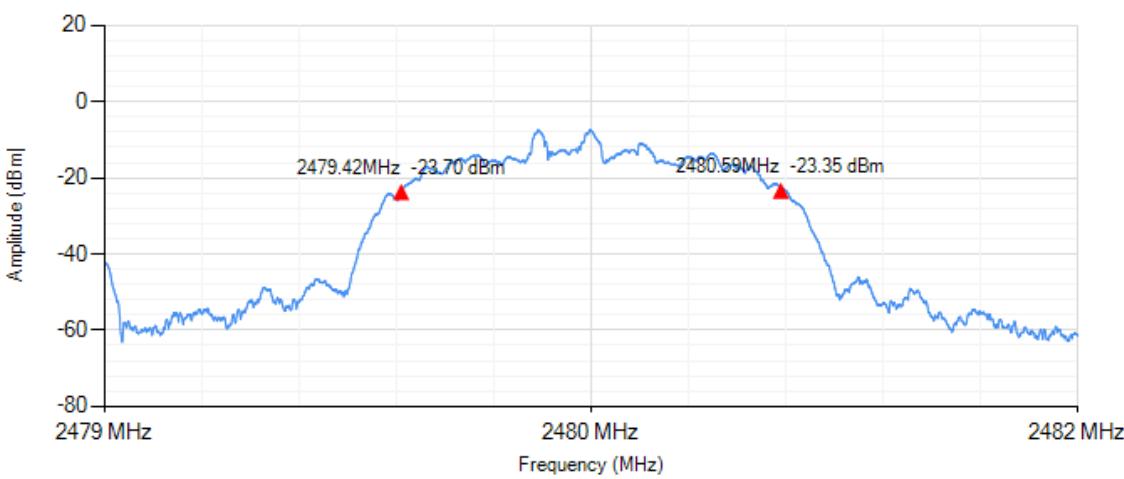

Mode	Channel	Measured Frequency (MHz)		Limit (MHz)	Result
		Low	High		
GFSK	Low	2401.57	2402.41	2400.00~2483.50	Pass
	High	2479.57	2480.42		
$\pi/4$ DQPSK	Low	2401.41	2402.57	2400.00~2483.50	Pass
	High	2479.41	2480.58		
8DPSK	Low	2401.42	2402.59	2400.00~2483.50	Pass
	High	2479.42	2480.59

## 7. Transmitter Unwanted Emissions in the Out-of-band Domain

### 7.1 Standard Application

According to section 4.3.1.9.3&4.3.2.8.3, the transmitter unwanted emissions in the out-of-band domain but outside the allocated band, shall not exceed the values provided by the mask in figure below:

Within the 2400MHz to 2 483.5MHz band, the Out-of-band emissions are fulfilled by compliance with the Occupied Channel Bandwidth requirement.

### 7.2 Test procedure

According to the section 5.4.8.2.1, the measurement procedure shall be as follows:

The Out-of-band emissions within the different horizontal segments of the mask provided in figures 1 and 3 shall be measured using the steps below. This method assumes the spectrum analyser is equipped with the Time Domain Power option.

#### Step 1:

- Connect the UUT to the spectrum analyser and use the following settings:
- Centre Frequency: 2484MHz
- Span: 0Hz
- Resolution BW: 1MHz
- Filter mode: Channel filter
- Video BW: 3MHz
- Detector Mode: RMS
- Trace Mode: Max Hold
- Sweep Mode: Continuous
- Sweep Points: Sweep Time [s] / (1  $\mu$  s) or 5 000 whichever is greater
- Trigger Mode: Video trigger

NOTE 1: In case video triggering is not possible, an external trigger source may be used.

- Sweep Time: > 120 % of the duration of the longest burst detected during the measurement of the RF Output Power

**Step 2:** (segment 2483.5MHz to 2483.5MHz + BW)

- Adjust the trigger level to select the transmissions with the highest power level.
- For frequency hopping equipment operating in a normal hopping mode, the different hops will result in signal bursts with different power levels. In this case the burst with the highest power level shall be selected.
- Set a window (start and stop lines) to match with the start and end of the burst and in which the RMS power shall be measured using the Time Domain Power function.
- Select RMS power to be measured within the selected window and note the result which is the RMS power within this 1MHz segment (2 483.5MHz to 2 484.5MHz). Compare this value with the applicable limit provided by the mask.
- Increase the centre frequency in steps of 1MHz and repeat this measurement for every 1MHz segment within the range 2483.5MHz to 2483.5MHz + BW. The centre frequency of the last 1MHz segment shall be set to 2483.5MHz + BW – 0.5MHz (which means this may partly overlap with the previous 1MHz segment).

**Step 3:** (segment 2483.5MHz + BW to 2483.5MHz + 2BW)

- Change the centre frequency of the analyser to 2 484 MHz + BW and perform the measurement for the first 1 MHz segment within range 2483.5MHz + BW to 2483.5MHz + 2BW. Increase the centre frequency in 1 MHz steps and repeat the measurements to cover this whole range. The centre frequency of the last 1MHz segment shall be set to 2483.5MHz + 2BW – 0.5MHz.

**Step 4:** (segment 2400MHz - BW to 2400MHz)

- Change the centre frequency of the analyser to 2399.5MHz and perform the measurement for the first 1MHz segment within range 2400MHz - BW to 2400MHz. Reduce the centre frequency in 1 MHz steps and repeat the measurements to cover this whole range. The centre frequency of the last 1 MHz segment shall be set to 2 400MHz - 2BW + 0.5MHz.

**Step 5:** (segment 2 400MHz - 2BW to 2 400MHz - BW)

- Change the centre frequency of the analyser to 2399.5MHz - BW and perform the measurement for the first 1 MHz segment within range 2400MHz - 2BW to 2400MHz - BW. Reduce the centre frequency in 1MHz steps and repeat the measurements to cover this whole range. The centre frequency of the last 1MHz segment shall be set to 2400MHz - 2BW + 0.5MHz.

**Step 6:**

- In case of conducted measurements on equipment with a single transmit chain, the declared antenna assembly gain "G" in dBi shall be added to the results for each of the 1 MHz segments and compared with the limits provided by the mask given in figure 1 or figure 3. If more than one antenna assembly is intended for this power setting, the antenna with the highest gain shall be considered.
- In case of conducted measurements on smart antenna systems (equipment with multiple transmit chains), the measurements need to be repeated for each of the active transmit chains. The declared antenna assembly gain "G" in dBi for a single antenna shall be added to these results. If more than one antenna assembly is intended for this power setting, the antenna with the highest gain shall be considered.

Comparison with the applicable limits shall be done using any of the options given below:

- Option 1: the results for each of the transmit chains for the corresponding 1 MHz segments shall be added. The additional beamforming gain "Y" in dB shall be added as well and the resulting values compared with the limits provided by the mask given in figure 1 or figure 3.

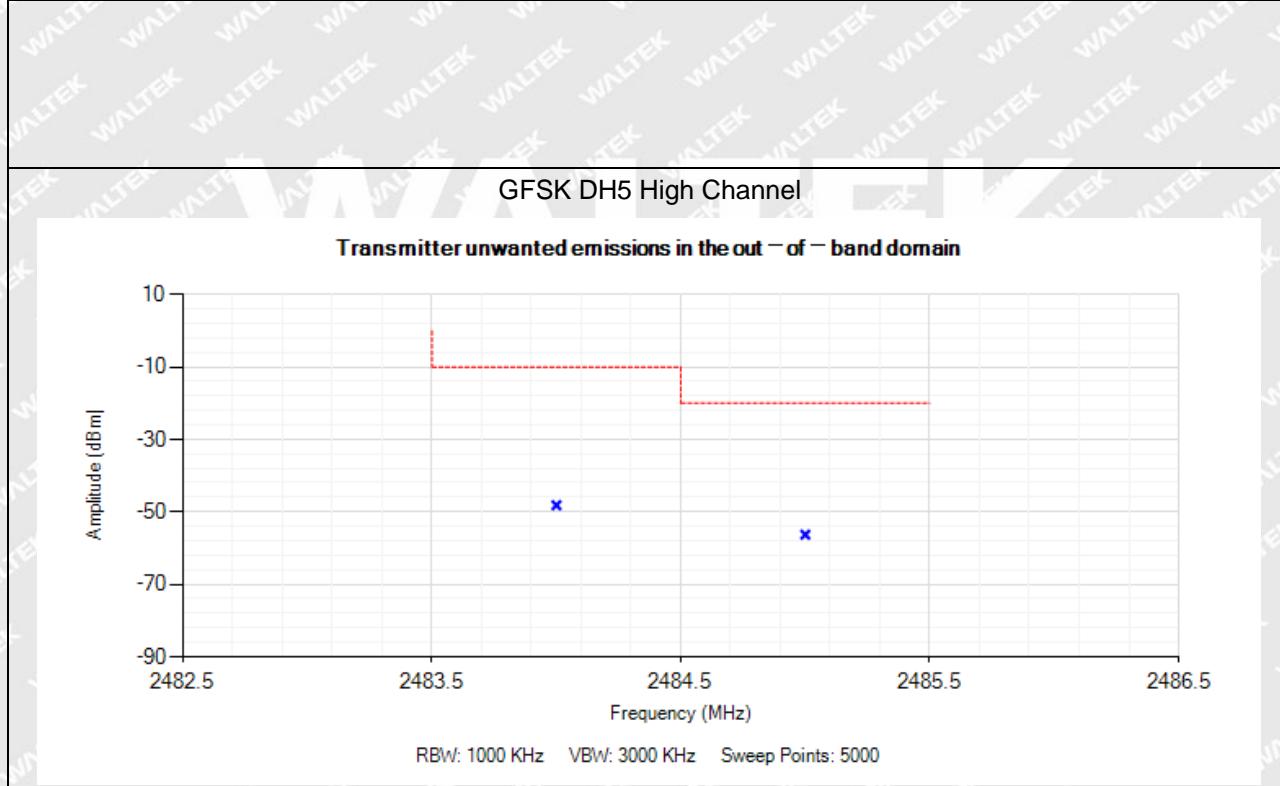

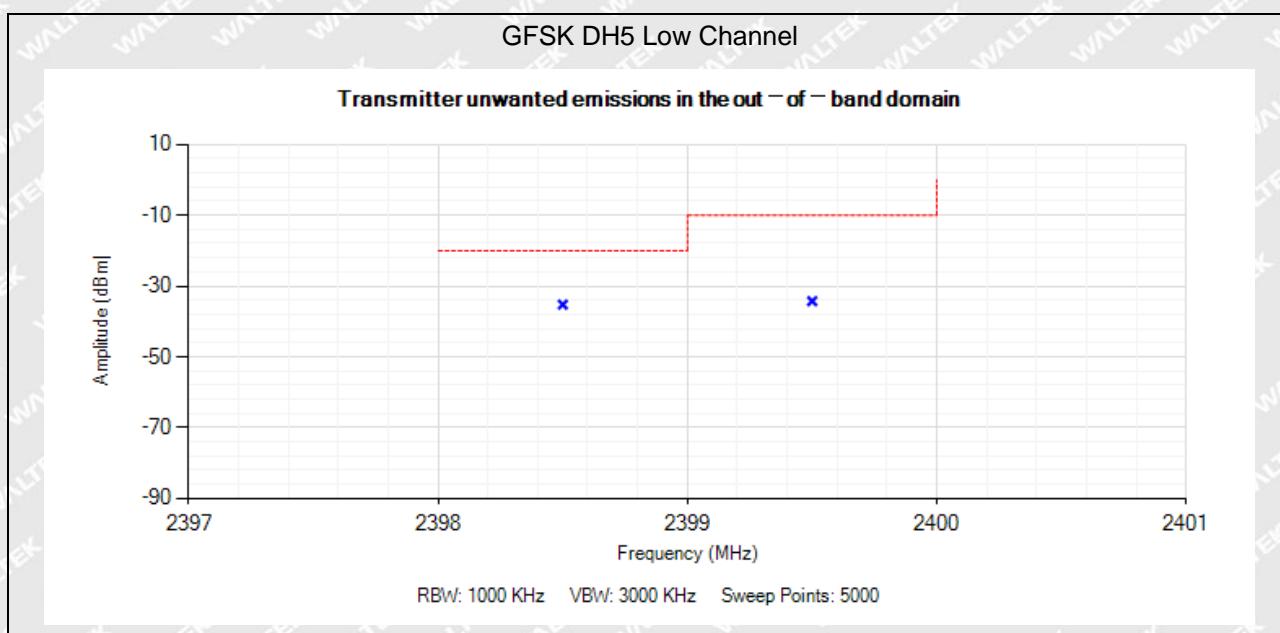

NOTE 2: A ch refers to the number of active transmit chains.

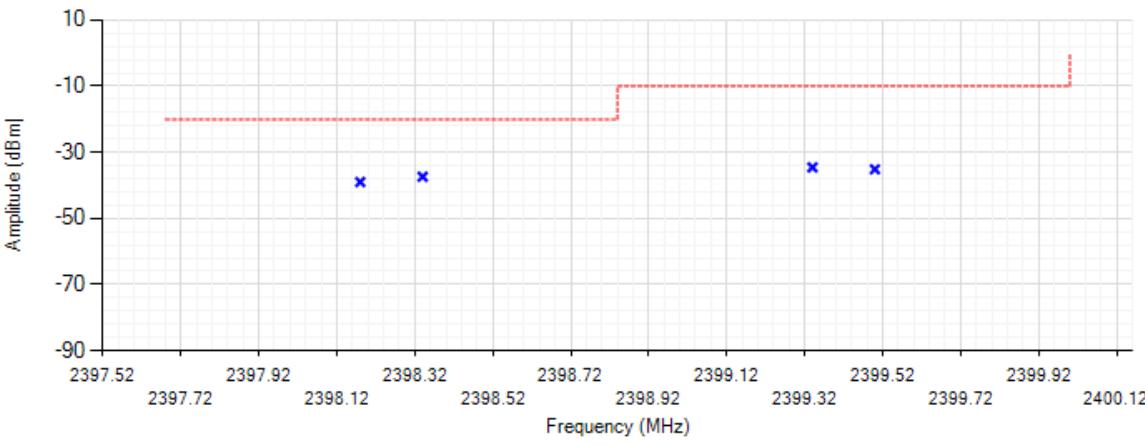

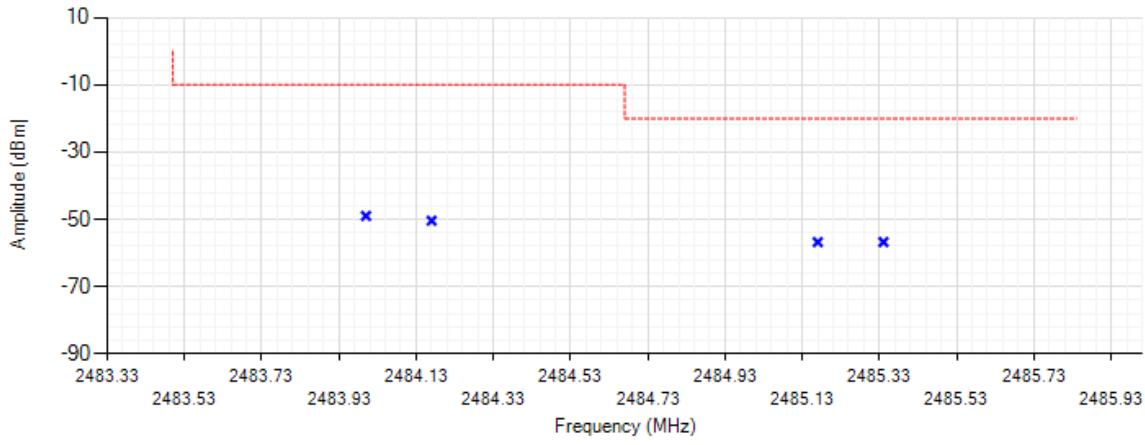

It shall be recorded whether the equipment complies with the mask provided in figure 1 or figure 3.

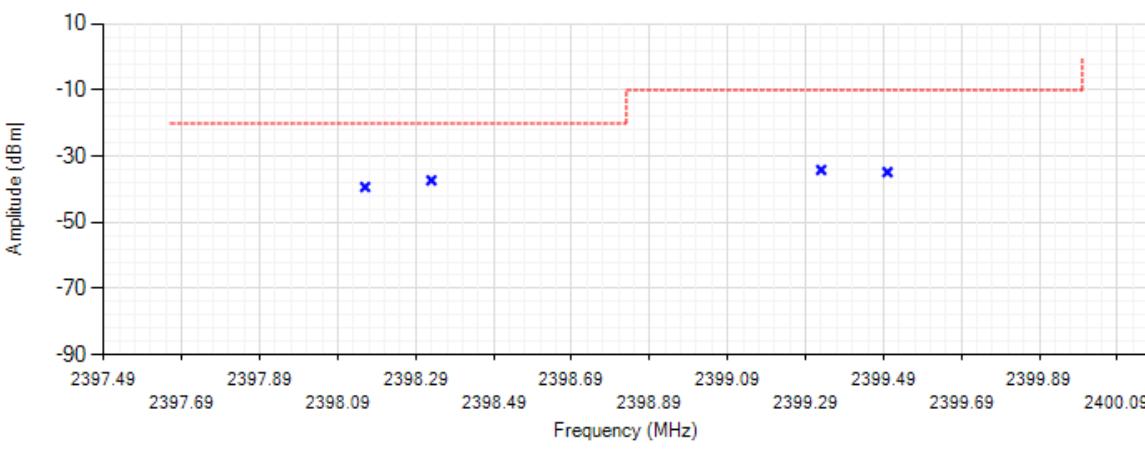

RBW=1MHz VBW=3MHz

### 7.3 Summary of Test Results/Plots

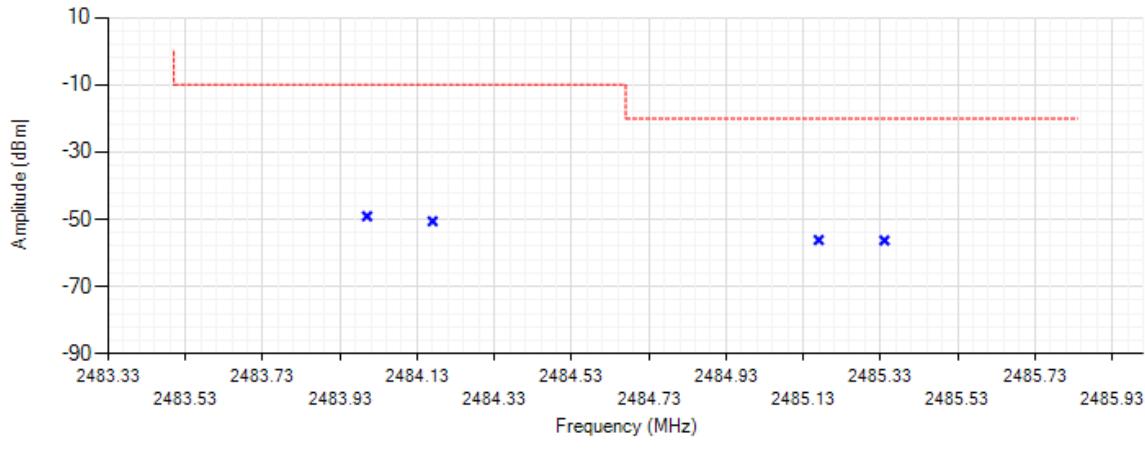

Test CH.	Test Segment	Max. Emissions Reading (dBm)		Limit
		Normal	dBm	
<b>Test Mode: GFSK DH5</b>				
Low	2400-BW to 2400	-34.251	-10

## 8. Transmitter Unwanted Emissions in the Spurious Domain

### 8.1 Standard Applicable

According to section 4.3.1.10.3& 4.3.2.9.3, the transmitter unwanted emissions in the spurious domain shall not exceed the values given in the following table.

Transmitter limit for spurious emissions

Frequency range	Maximum power	Bandwidth
30MHz to 47MHz	-36dBm	100kHz
47MHz to 74MHz	-54dBm	100kHz
74MHz to 87.5MHz	-36dBm	100kHz
87.5MHz to 118MHz	-54dBm	100kHz
118MHz to 174MHz	-36dBm	100kHz
174MHz to 230MHz	-54dBm	100kHz
230MHz to 470MHz	-36dBm	100kHz
470MHz to 694MHz	-54dBm	100kHz
694MHz to 1GHz	-36dBm	100kHz
1GHz to 12.75GHz	-30dBm	1MHz

### 8.2 Test Procedure

The device under test has an integral antenna and the radiated measurement shall apply to the device, using the method of measurement as described in the EN300328 section 5.4.9.2

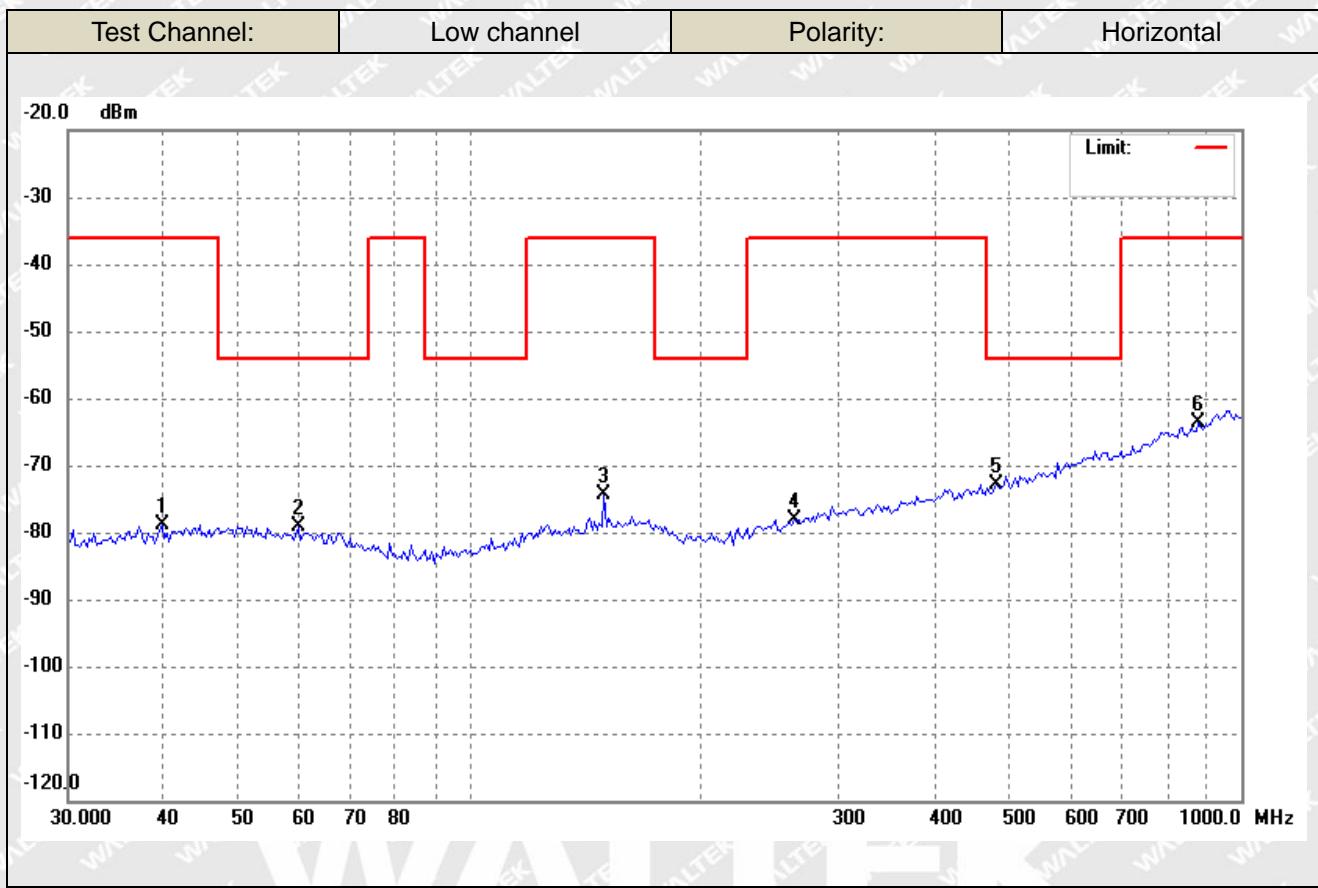

RBW=100kHz      VBW=300kHz      30MHz-1GHz  
 RBW=1MHz      VBW=3MHz      1GHz-12.75GHz

### 8.3 Summary of Test Results/Plots

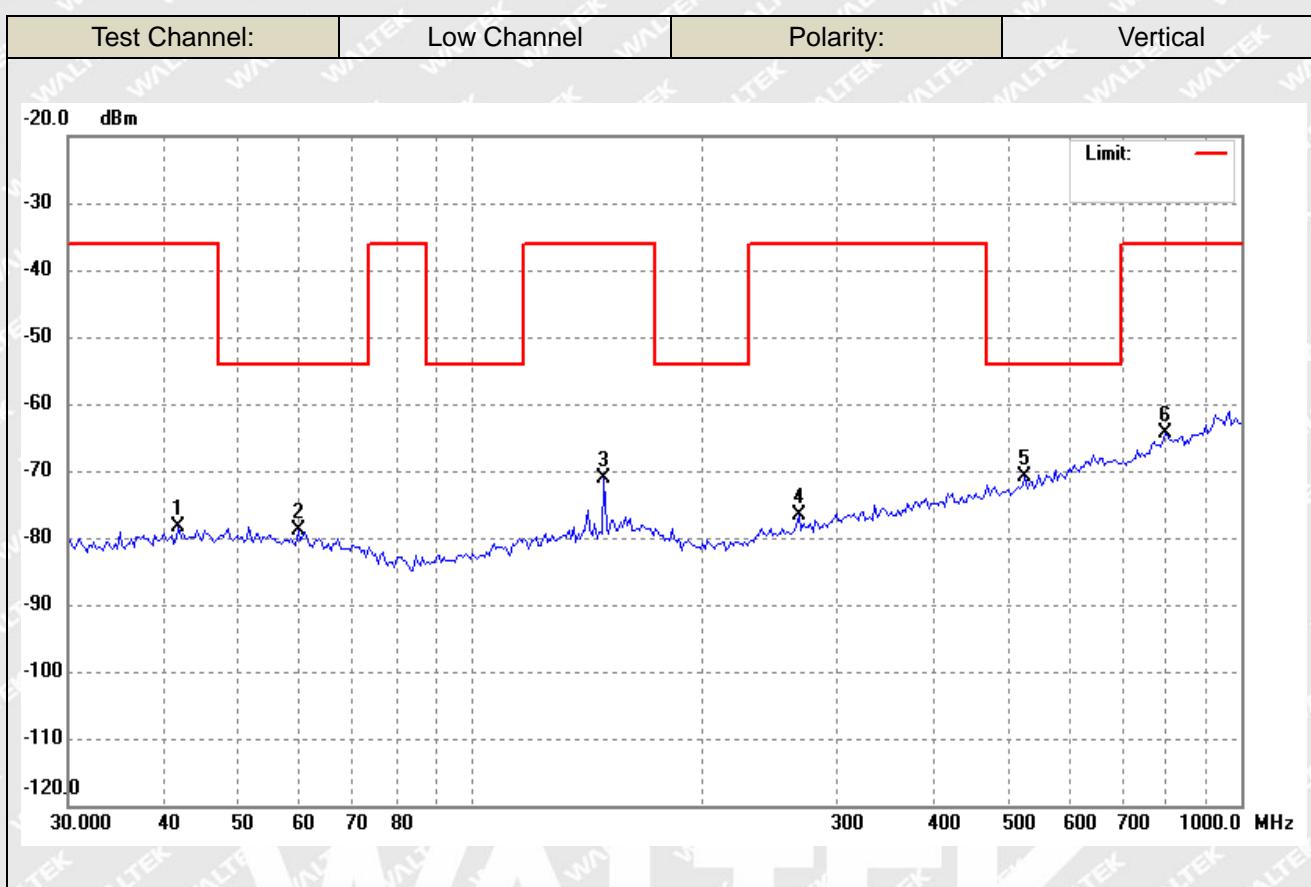

According to the data, the EUT complied with the EN 300328 standards, and had the worst cases:

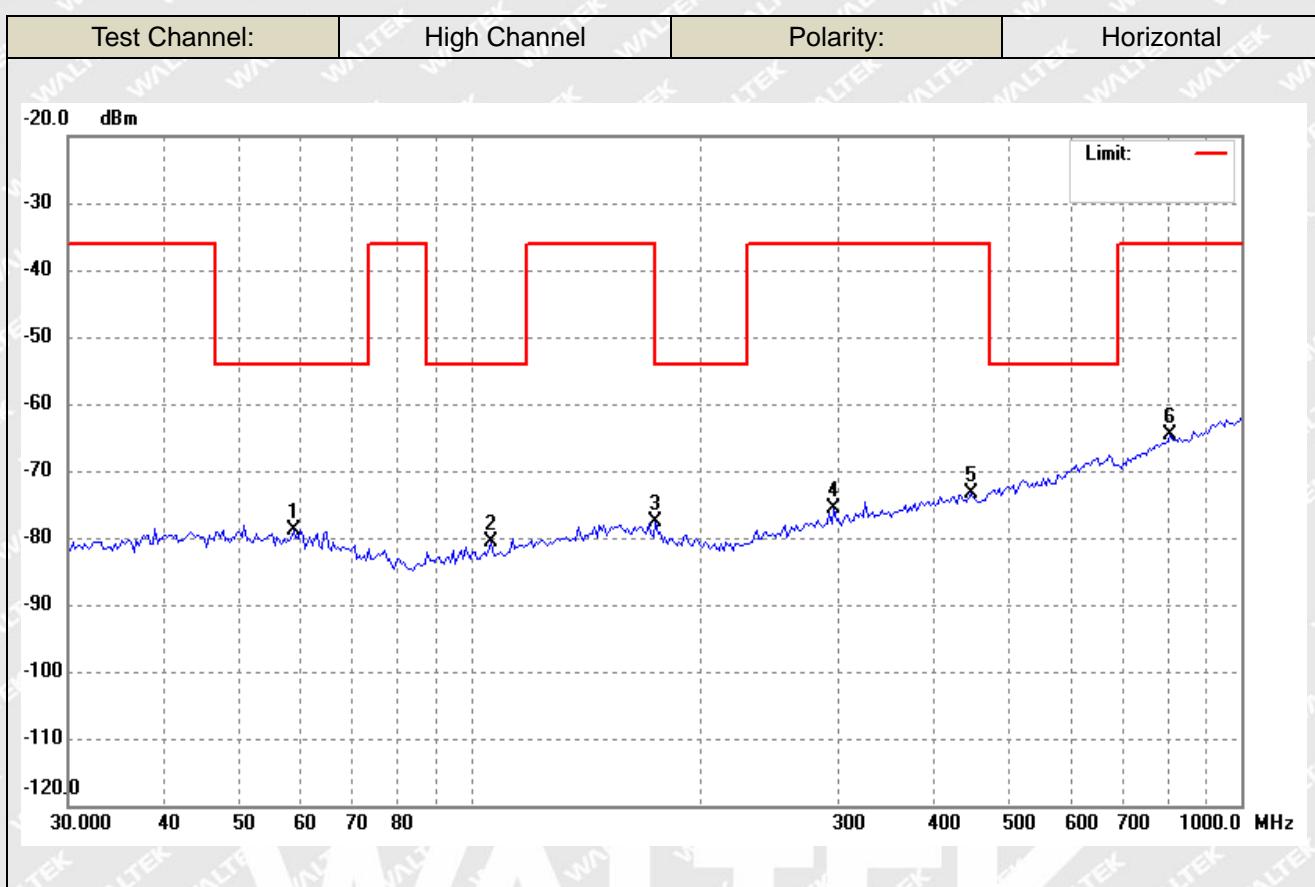

➤ Spurious Emission From 30MHz To 1GHz  
For EDR

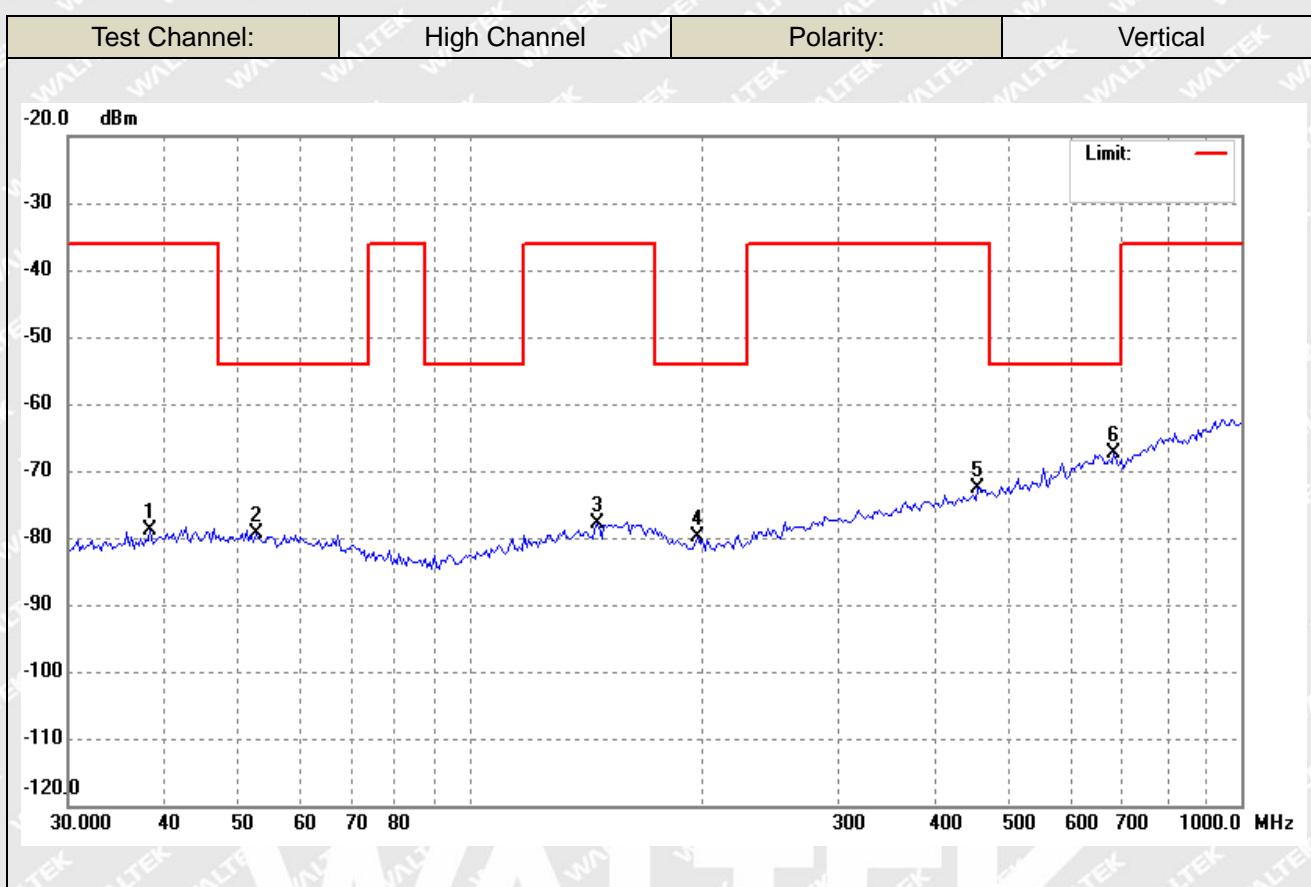

No.	Frequency (MHz)	Reading 26(C)/54%RH	Correct Factor(dB)	Result (dBm)	Limit (dBm)	Margin (dB)	Remark

7440	-56.26	10.28	-45.98	-30	-15.98	V

Note 1: Testing is carried out with frequency rang 30MHz to 12.75GHz, which above 4<sup>th</sup> Harmonics are attenuated more than 20dB below the permissible limits or the field strength is too small to be measured.

Note 2: this EUT was tested in 3 orthogonal positions and the worst case position data was reported.

➤ **Conducted Transmitter Spurious Emission:**

Note 1: Testing is carried out with frequency rang 30MHz to 12.75GHz, which emissions are too small are not list above. Test The worst case is DH5.

## 9. Receiver Spurious Emissions

### 9.1 Standard Applicable

According to section 4.3.1.11.3&4.3.2.10.3, the spurious emissions of the receiver shall not exceed the values given in table below:

NOTE: In case of equipment with antenna connectors, these limits apply to emissions at the antenna port (conducted) and to the emissions radiated by the cabinet. In case of integral antenna equipment (without temporary antenna connectors), these limits apply to emissions radiated by the equipment. Spurious emission limits for receivers

Frequency range	Maximum power	Bandwidth
30MHz to 1GHz	-57dBm	100kHz
1GHz to 12.75GHz	-47dBm	1MHz

### 9.2 Test Procedure

The device under test has an integral antenna and the radiated measurement shall apply to the device, using the method of measurement as described in the EN300328 section 5.4.10.2.

RBW=100kHz      VBW=300kHz      30MHz-1GHz

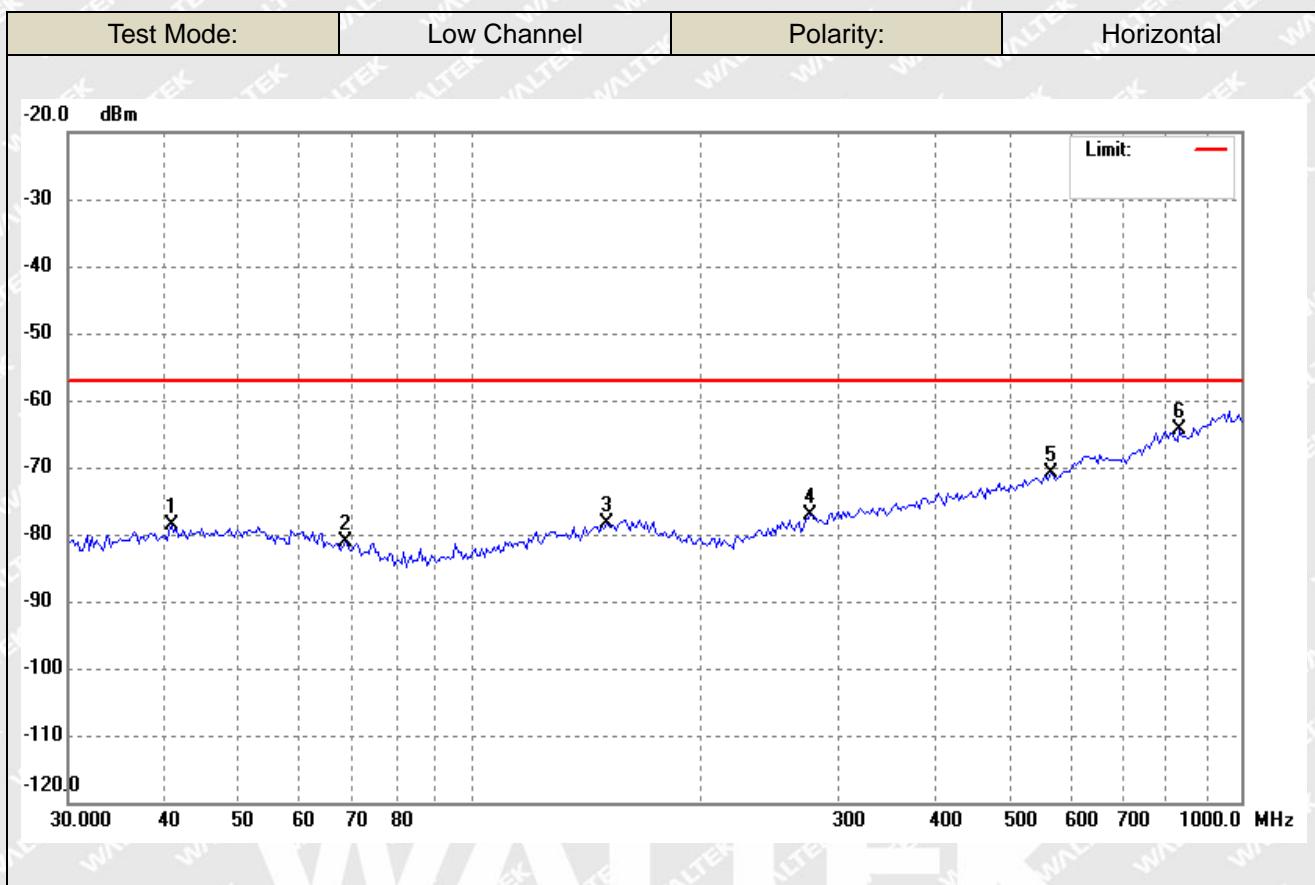

RBW=1MHz      VBW=3MHz      1GHz-12.75GHz

### 9.3 Summary of Test Results/Plots

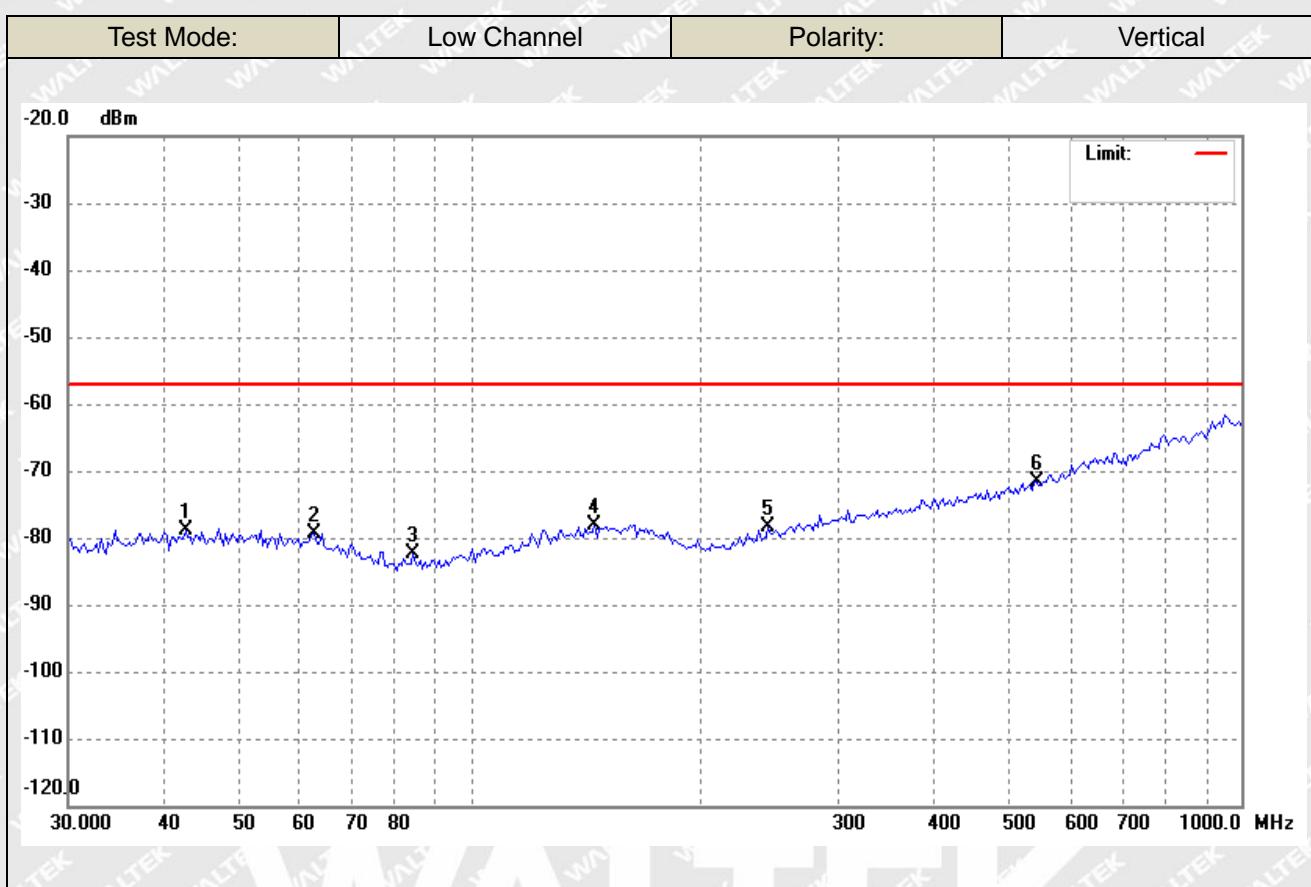

According to the data, the EUT complied with the EN 300328 standards, and had the worst case:

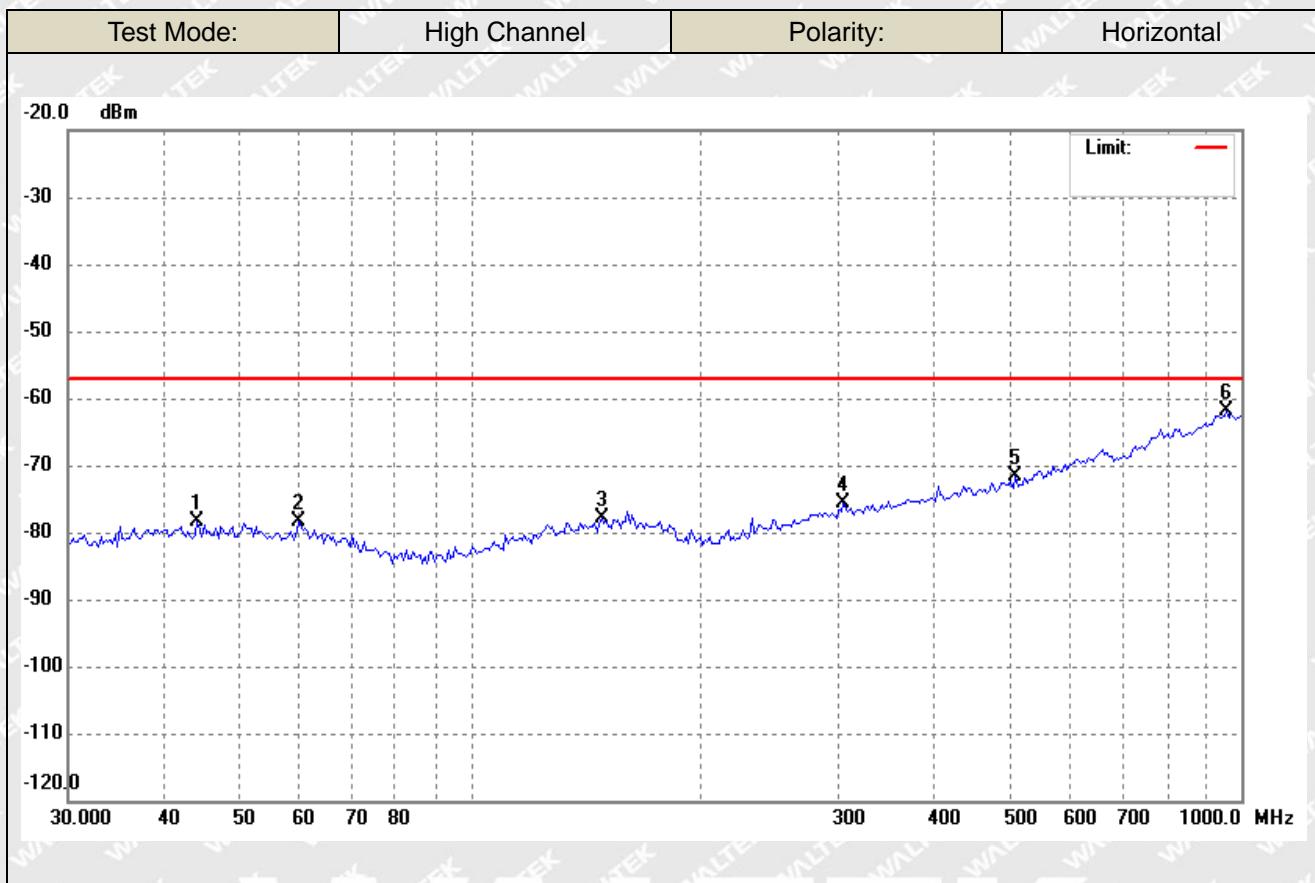

## ➤ Receiver Spurious Emission From 30MHz To 1GHz

Note: Testing is carried out with frequency rang 30MHz to 12.75GHz, which above 1GHz are attenuated more than 20dB below the permissible limits or the field strength is too small to be measured.

# WALTEK

**Conducted Receiver Spurious Emission:**

*Note 1: Testing is carried out with frequency rang 30MHz to 12.75GHz, which emissions are too small are not list above.*

## 10. Receiver Blocking

### 10.1 Standard Application

Receiver blocking is a measure of the ability of the equipment to receive a wanted signal on its operating channel without exceeding a given degradation due to the presence of an unwanted input signal (blocking signal) on frequencies other than those of the operating band and spurious responses.

#### Performance Criteria

For equipment that supports a PER or FER test to be performed, the minimum performance criterion shall be a PER or FER less than or equal to 10 %.

For equipment that does not support a PER or a FER test to be performed, the minimum performance criterion shall be no loss of the wireless transmission function needed for the intended use of the equipment.

The minimum performance criterion shall be a PER less than or equal to 10 %. The manufacturer may declare alternative performance criteria as long as that is appropriate for the intended use of the equipment (see clause 5.4.1.t)).

While maintaining the minimum performance criteria as defined in clause 4.3.1.12.3, the blocking levels at specified frequency offsets shall be equal to or greater than the limits defined for the applicable receiver category provided in table 6, table 7 or table 8.

#### Receiver category 1

Adaptive equipment with a maximum RF output power greater than 10 dBm e.i.r.p. shall be considered as receiver category 1 equipment.

#### Receiver category 2

non-adaptive equipment with a Medium Utilization (MU) factor greater than 1 % and less than or equal to 10 % (irrespective of the maximum RF output power); or equipment (adaptive or non-adaptive) with a maximum RF output power greater than 0 dBm e.i.r.p. and less than or equal to 10 dBm e.i.r.p.

#### Receiver category 3

non-adaptive equipment with a maximum Medium Utilization (MU) factor of 1 % (irrespective of the maximum RF output power); or equipment (adaptive or non-adaptive) with a maximum RF output power of 0 dBm e.i.r.p.

Table 6: Receiver Blocking parameters for Receiver Category 1 equipment

<b>Wanted signal mean power from companion device (dBm) (see notes 1 and 4)</b>	<b>Blocking signal frequency (MHz)</b>	<b>Blocking signal power (dBm) (see note 4)</b>	<b>Type of blocking signal</b>
(-133 dBm + 10 × log <sub>10</sub> (OCBW)) or -68 dBm whichever is less (see note 2)	2 380 2 504		
(-139 dBm + 10 × log <sub>10</sub> (OCBW)) or -74 dBm whichever is less (see note 3)	2 300 2 330 2 360 2524 2584 2674	-34	CW

NOTE 1: OCBW is in Hz.

NOTE 2: In case of radiated measurements using a companion device and the level of the wanted signal from the companion device cannot be determined, a relative test may be performed using a wanted signal up to P<sub>min</sub> + 26 dB where P<sub>min</sub> is the minimum level of wanted signal required to meet the minimum performance criteria as defined in clause 4.3.1.12.3 in the absence of any blocking signal.

NOTE 3: In case of radiated measurements using a companion device and the level of the wanted signal from the companion device cannot be determined, a relative test may be performed using a wanted signal up to P<sub>min</sub> + 20 dB where P<sub>min</sub> is the minimum level of wanted signal required to meet the minimum performance criteria as defined in clause 4.3.1.12.3 in the absence of any blocking signal.

NOTE 4: The level specified is the level at the UUT receiver input assuming a 0 dBi antenna assembly gain. In case of conducted measurements, this level has to be corrected for the (in-band) antenna assembly gain (G). In case of radiated measurements, this level is equivalent to a power flux density (PFD) in front of the UUT antenna with the UUT being configured/positioned as recorded in clause 5.4.3.2.2.

Table 7: Receiver Blocking parameters receiver category 2 equipment

<b>Wanted signal mean power from companion device (dBm) (see notes 1 and 3)</b>	<b>Blocking signal frequency (MHz)</b>	<b>Blocking signal power (dBm) (see note 3)</b>	<b>Type of blocking signal</b>
(-139 dBm + 10 × log <sub>10</sub> (OCBW) + 10 dB) or (-74 dBm + 10 dB) whichever is less (see note 2)	2380 2504 2300 2584	-34	CW

NOTE 1: OCBW is in Hz.

NOTE 2: In case of radiated measurements using a companion device and the level of the wanted signal from the companion device cannot be determined, a relative test may be performed using a wanted signal up to P<sub>min</sub> + 26 dB where P<sub>min</sub> is the minimum level of wanted signal required to meet the minimum performance criteria as defined in clause 4.3.1.12.3 in the absence of any blocking signal.

NOTE 3: The level specified is the level at the UUT receiver input assuming a 0 dBi antenna assembly gain. In case of conducted measurements, this level has to be corrected for the (in-band) antenna assembly gain (G). In case of radiated measurements, this level is equivalent to a power flux density (PFD) in front of the UUT antenna with the UUT being configured/positioned as recorded in clause 5.4.3.2.2.

Table 8: Receiver Blocking parameters receiver category 3 equipment

<b>Wanted signal mean power from companion device (dBm) (see notes 1 and 3)</b>	<b>Blocking signal frequency (MHz)</b>	<b>Blocking signal power (dBm) (see note 3)</b>	<b>Type of blocking signal</b>
(-139 dBm + 10 × log <sub>10</sub> (OCBW) + 20 dB) or (-74 dBm + 20 dB) whichever is less (see note 2)	2380 2504 2300 2584	-34	CW

NOTE 1: OCBW is in Hz.

NOTE 2: In case of radiated measurements using a companion device and the level of the wanted signal from the companion device cannot be determined, a relative test may be performed using a wanted signal up to P<sub>min</sub> + 26 dB where P<sub>min</sub> is the minimum level of wanted signal required to meet the minimum performance criteria as defined in clause 4.3.1.12.3 in the absence of any blocking signal.

NOTE 3: The level specified is the level at the UUT receiver input assuming a 0 dBi antenna assembly gain. In case of conducted measurements, this level has to be corrected for the (in-band) antenna assembly gain (G). In case of radiated measurements, this level is equivalent to a power flux density (PFD) in front of the UUT antenna with the UUT being configured/positioned as recorded in clause 5.4.3.2.2.

## 10.2 Test Procedure

- Step 1: • For non-frequency hopping equipment, the UUT shall be set to the lowest operating channel.
- Step 2: • The blocking signal generator is set to the first frequency as defined in the appropriate table corresponding to the receiver category and type of equipment.
- Step 3: • With the blocking signal generator switched off, a communication link is established between the UUT and the associated companion device using the test setup shown in figure 6. The variable attenuator is set to a value that achieves the minimum performance criteria as specified in clause 4.3.1.12.3 or clause 4.3.2.11.3 with a resolution of at least 1 dB. The resulting level for the wanted signal at the input of the UUT is Pmin. This value shall be measured and recorded in the test report.
- The signal level is increased by the value provided in the table corresponding to the receiver category and type of equipment.
- Step 4: • The blocking signal at the UUT is set to the level provided in the table corresponding to the receiver category and type of equipment. It shall be verified and recorded in the test report that the performance criteria as specified in clause 4.3.1.12.3 or clause 4.3.2.11.3 is met.
- Step 5: • Repeat step 4 for each remaining combination of frequency and level for the blocking signal as provided in the table corresponding to the receiver category and type of equipment.
- Step 6: • For non-frequency hopping equipment, repeat step 2 to step 5 with the UUT operating at the highest operating channel.

## 10.3 Test Setup

According to the section 5.4.11.2.1, the test block diagram shall be used.

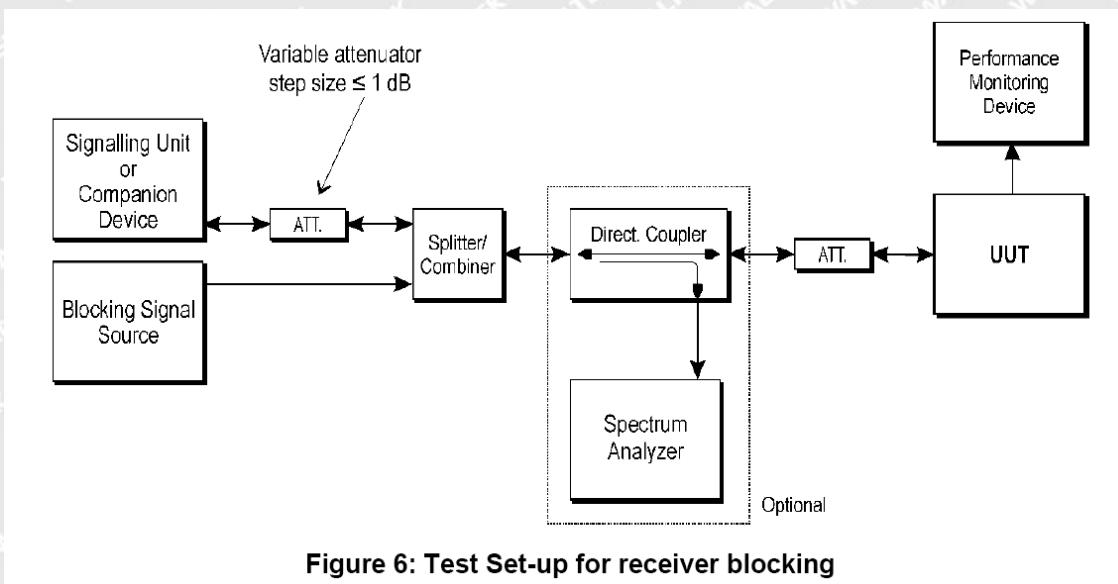

Figure 6: Test Set-up for receiver blocking

All test procedure is carried to the section 5.4.11.2.1

RBW/VBW=8MHz/30MHz

## 10.4 Summary of Test Results/Plots

The product BR/EDR is receiver category3

Mode/ Channel	Wanted signal power (dBm)	Blocking signal Frequency (MHz)	Blocking signal power (dBm)	Test PER(%)	Limit(%)	Result
GFSK-Hopping	-60.58	2380	-34.58	0.20	<10	Pass
		2504				
		2300				
		2584				
$\pi/4$ DQPSK- Hopping	-58.58	2380	-34.58	0.30	<10	Pass
		2504				
		2300				
		2584				
8DPSK-Hopping	-58.58	2380	-34.58	0.10	<10	Pass
		2504				
		2300				
		2584				

\*communication link is established between the UUT and the associated companion device using the test setup shown in figure 6. While the Companion device (CMW500) adjust to a level which can obtain the minimum performance criteria PER 10%, This level define to Pmin

Remark: the smallest channel bandwidth shall be used together with the lowest data rate for this channel bandwidth. This mode of operation are aligned with the performance criteria defined in clause 4.3.1.12.3 or clause 4.3.2.11.3 as declared by the manufacturer (see clause 5.4.1.t)).

## 1. GENERAL INFORMATION

### 1.1 Product Description for Equipment Under Test (EUT)

<b>General Description of EUT</b>	
Product Name:	wireless power bank speaker
Trade Name:	/
Model No.:	MO6887
Adding Model(s):	/
Rated Voltage:	Battery DC 3.7V
Battery Capacity:	4000mAh
Adapter Model:	/
Software Version:	V1.0
Hardware Version:	V1.2
<i>Note: The test data is gathered from a production sample provided by the manufacturer.</i>	

<b>Technical Characteristics of EUT</b>	
Frequency Range:	100-205kHz
Radiated H-Field:	39.21dB <sub>A</sub> /m(@3m)
Type of Antenna:	Coil Antenna

➤ Overview of operational modes within a WPT system

<b>Operational Mode</b>	<b>Set-up</b>	<b>Function of base station</b>	<b>Function of mobile device</b>	<b>Test scenario</b>	<b>Conformance Requirements</b>
Mode 1: base station in stand-by, idle mode	Single device	Transmitter	Not applicable	Single radiation test (TX) with the base station/charging pad. The test set-up as described in clause 6.1.2 shall be used.	Operating frequency range (clause 4.3.3) H-Field emission (clause 4.3.4) TX spurious (clauses 4.3.5, 4.3.6 and 4.3.7) Performance criteria test (RX)
Mode 2: Communication before charging, adjustment charging mode / position	In combination	TX and RX	TX and RX	Specific test setup, declared by the manufacturer. Manufacturer shall declare the maximal distance between base station and mobile device the WPT system is able to communicate (distance D). The test setup- up shall be performed with the largest communication distance. The test set-up as described in clause 6.1.3 shall be	Operating frequency range (clause 4.3.3) H-Field emission (clause 4.3.4) TX spurious (clauses 4.3.5, 4.3.6 and 4.3.7) Wanted performance criteria test (RX test) (clause 4.4)
Mode3: Communication alignment	WPT system	TX and RX	TX and RX	Worst case alignment Both tests can be performed within one set-up, worst-case alignment.	Operating frequency range (clause 4.3.3) H-Field emission (clause 4.3.4)
Mode 4: energy transmission	WPT system alignment	TX and RX	TX and RX	The test set-up as described in clause 6.1.4 shall be used.	TX spurious (clauses 4.3.5, 4.3.6 and 4.3.7) Wanted Performance criteria test (RX test) (clause 4.4)

## 1.2 Test Standards

The tests were performed according to following standards:

**ETSI EN 303 417 V1.1.1 (2017-09)**: Wireless power transmission systems, using technologies other than radio frequency beam in the 19 - 21kHz, 59 - 61kHz, 79 - 90kHz, 100 - 300kHz, 6765 - 6795kHz ranges; Harmonised Standard covering the essential requirements of article 3.2 of Directive 2014/53/EU.

**Maintenance of compliance** is the responsibility of the manufacturer. Any modification of the product maybe which result in lowering the immunity should be checked to ensure compliance has been maintained.

## 1.3 Test Methodology

All measurements contained in this report were conducted with ETSI EN 300330,

The equipment under test (EUT) was configured to measure its highest possible emission level. For more detail refer to the Operating Instructions.

The equipment under test (EUT) was configured to measure its highest possible radiation level. The test modes were adapted accordingly in reference to the Operating Instructions.

**WALTEK**

## 1.4 EUT Setup and Test Mode

The equipment under test (EUT) was configured to measure its highest possible emission/immunity level. The test modes were adapted according to the operation manual for use, the EUT was operated in the engineering mode to fix the Tx/Rx frequency that was for the purpose of the measurements, more detailed description as follows:

<b>Test Mode List</b>			
Test Mode	Description	Remark	
TM1	Wireless Charging	(Wireless Output:5W)	
TM2	Wireless Charging	(Wireless Output:10W)	
<b>Test Conditions</b>

## 1.5 Measurement Uncertainty

<b>Measurement uncertainty</b>		
Parameter	Uncertainty	Note
Radiated H-field	$\pm 3.0\text{dB}$	(1)
Permitted range of operating frequency	10Hz	(1)
Permitted frequency range of the modulation bandwidth	$\pm 10\text{Hz}$	(1)
Radiated spurious emissions	0.9-30MHz $\pm 5.2\text{dB}$	(1)
	30-200MHz $\pm 4.52\text{dB}$	(1)
	0.2-1GHz $\pm 5.56\text{dB}$	(1)
	1-6GHz $\pm 3.84\text{dB}$	(1)
	6-18GHz $\pm 3.92\text{dB}$	(1)

(1) This uncertainty represents an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of  $k=1.96$ .

**WALTEK**

## 2. SUMMARY OF TEST RESULTS

Standards	Reference	Description of Test Item	Result
ETSI EN 303 417	4.3.2	Permitted range of operating frequencies	Pass
	4.3.3	Operating frequency ranges	Pass
	4.3.4	H-field requirements	Pass
	4.3.5	Transmitter spurious emissions	Pass
	4.3.6	Transmitter out of band (OOB) emissions	Pass
	4.3.7	WPT system unwanted conducted emissions	N/A
	4.4.2	Receiver blocking	Pass

Pass: The EUT complies with the essential requirements in the standard.  
Fail: The EUT does not comply with the essential requirements in the standard.  
N/A: not applicable.

# WALTEK

### 3. Permitted range of operating frequency

#### 3.1 Standard Applicable

1. This applies to all WPT systems.
2. The permitted range of operating frequencies denotes the frequency ranges set out in Table 1. It likewise denotes the respective frequency range for accommodation of the fundamental WPT frequency of the EUT within its operating frequency range (OFR).
3. Limits

The permitted range of operating frequency range(s) for intentional emissions shall be within 19 - 21 kHz, 59 - 61 kHz, 79 - 90kHz, 100 - 300kHz, 6765 - 6 795kHz, see Table 2.

#### 3.2 Test Procedure

Please refer to ETSI EN 303 417 subclause 6.2.2

#### 3.3 Summary of Test Results

Permitted range of operating frequencies				
$F_L$ (kHz)	$F_H$ (kHz)	Limit (kHz)		Result
100	205	$F_L \geq 100$	$F_H \leq 300$	PASS

## 4. Operating frequency ranges

### 4.1 Standard Applicable

The operating frequency range is the frequency range over which the WPT system is intentionally transmitting (all operational modes, see clause 4.2.3, Table 2).

The operating frequency range(s) of the WPT system are determined by the lowest ( $f_L$ ) and highest frequency ( $f_H$ ) as occupied by the power envelope.

The WPT system could have more than one operating frequency range.

For a single frequency systems the OFR is equal to the occupied bandwidth (OBW) of the WPT system. For multi-frequency systems the OFR is described in Figures 2 and 3.

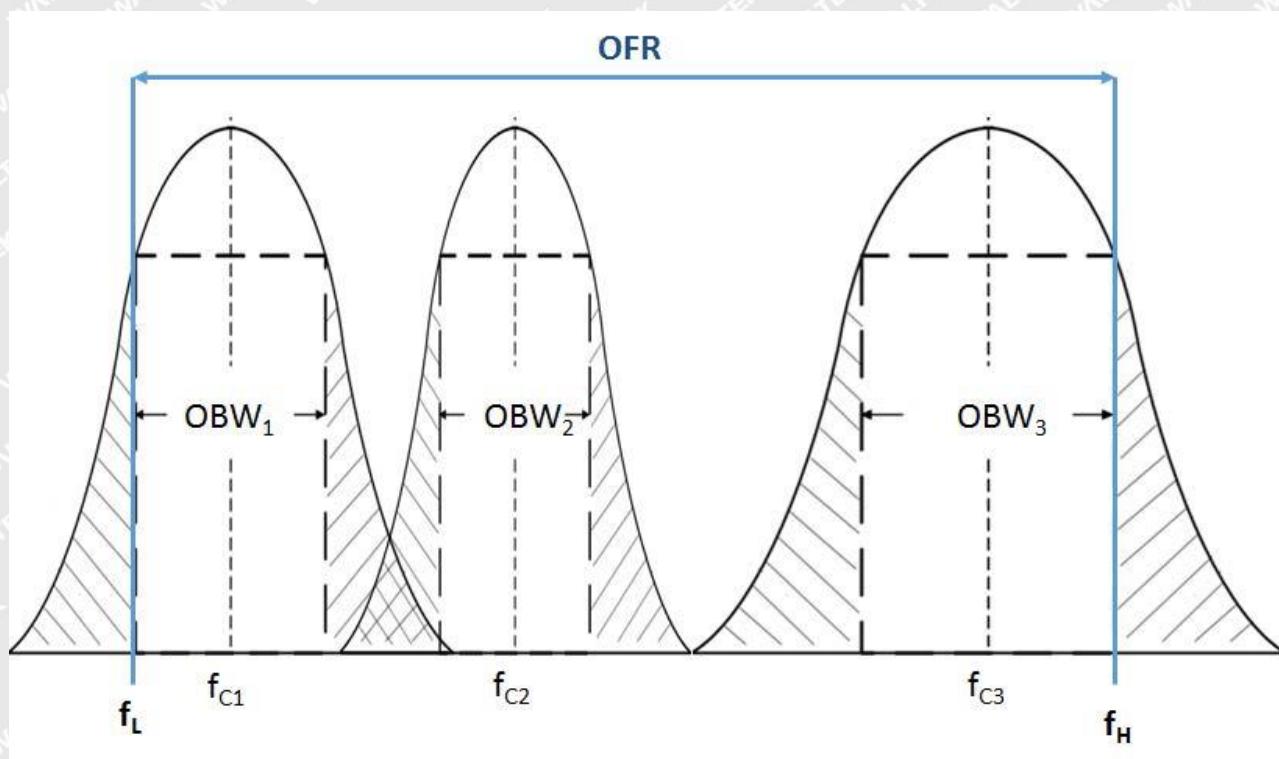

Figure 2: OFR of a multi - frequency WPT system within one frequency range of Table 2 and within one WPT system cycle time

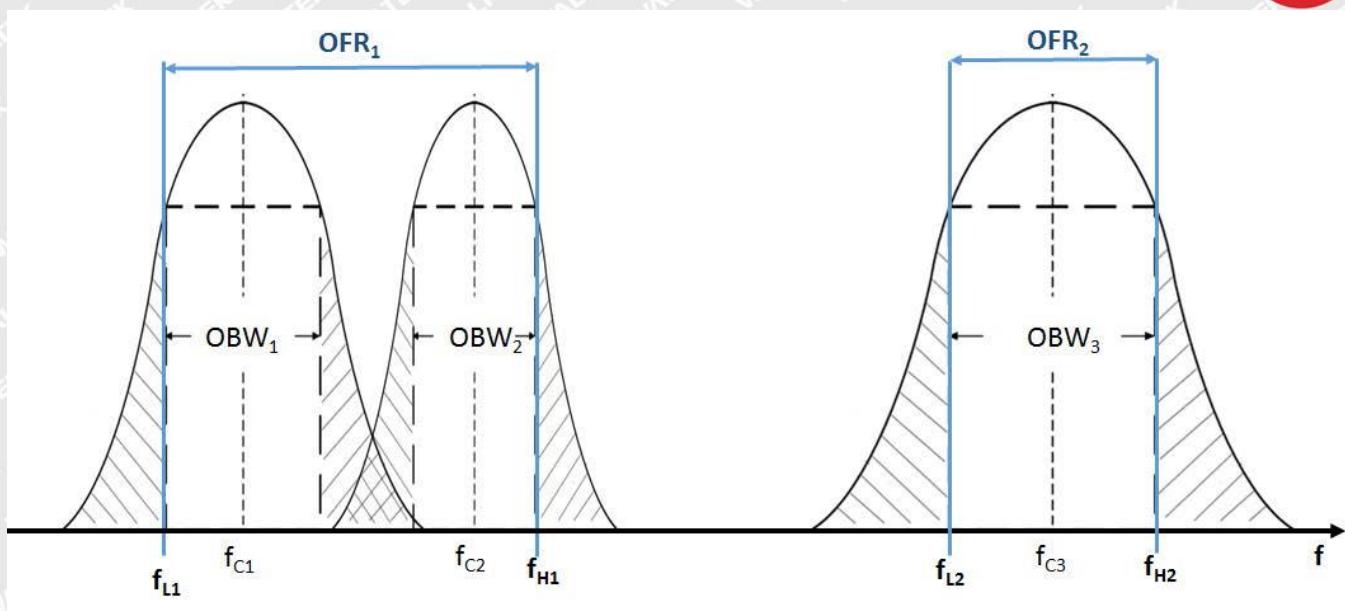

Figure 3: OFR of a multi - frequency WPT system within two frequency ranges of Table 2 and within one WPT system cycle time

#### Limits

The operating frequency range for emissions shall be within one of the following limits: 19 - 21kHz, 59 - 61kHz, 79 - 90kHz, 100 - 300kHz, 6765 - 6795kHz.

## 4.2 Test Procedure

Please refer to ETSI EN 303 417 subclause 6.2.2

## 4.3 Summary of Test Results/Plots

### TM1

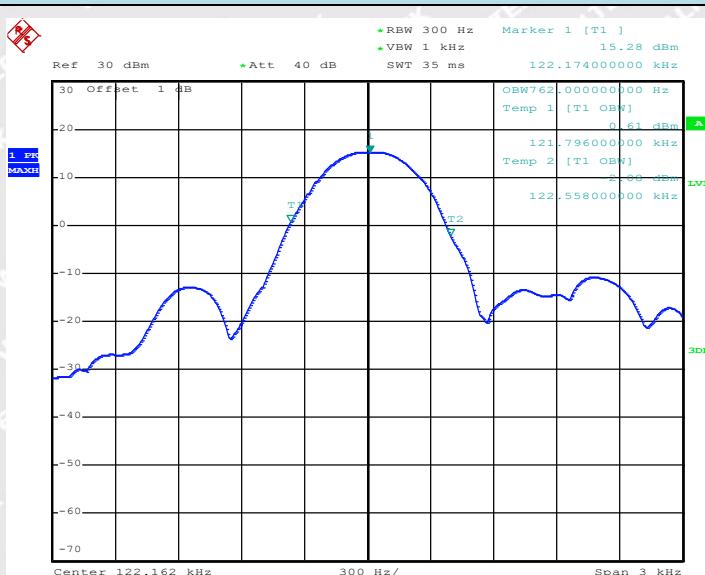

Operating frequency range(s) (OFR)				
$F_L$ (kHz)	$F_H$ (kHz)	Limit (kHz)		Result
121.796	122.558	$F_L \geq 100$	$F_H \leq 300$	PASS

### TM2

Operating frequency range(s) (OFR)				
$F_L$ (kHz)	$F_H$ (kHz)	Limit (kHz)		Result
126.140	126.884	$F_L \geq 100$	$F_H \leq 300$	PASS

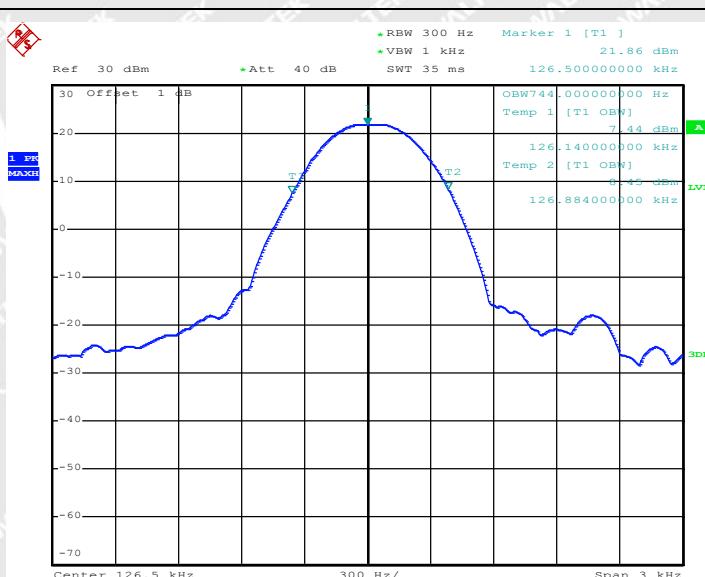

### Operating frequency range(s) (OFR)

Date: 22.FEB.2023 10:57:42

TM2

## 5. Transmitter H-field requirements

### 5.1 Standard Applicable

The radiated H-field is defined in the direction of maximum field strength under specified conditions of measurement.

The H-field limits are provided in Table 3.

They have been specified for control of any radiated emissions within the OFR originating from the WPT system (power transmission and accompanying data communication).

The H-field limits in Table 3 are EU wide harmonised according to EC Decision 2013/752/EU [i.2]. Further information is available in CEPT/ERC/REC 70-03 [i.1].

Table 3: H-field limits

Frequency range [MHz]	H-field strength limit [dB $\mu$ A/m at 10 m]	Comments
0.019 ≤ f < 0.021	72	
0.059 ≤ f < 0.061	69,1 descending 10 dB/dec above 0,059 MHz	See note 1
0.079 ≤ f < 0.090	67,8 descending 10 dB/dec above 0,079 MHz	See note 2
0.100 ≤ f < 0.119	42	
0.119 ≤ f < 0.135	66 descending 10 dB/dec above 0,119 MHz	See note 1
0.135 ≤ f < 0.140	42	
0.140 ≤ f < 0.1485	37.7	
0.1485 ≤ f < 0.30	-5	
6.765 ≤ f < 6.795	42	

NOTE 1: Limit is 42 dB $\mu$ A/m for the following spot frequencies: 60kHz ± 250Hz and 129.1kHz ± 500Hz.

NOTE 2: At the time of preparation of the present document the feasibility of increased limits for high power wireless power transmission systems to charge vehicles [i.4] was prepared. New specific requirements for such systems (e.g. higher H-field emission limits in the 79 - 90kHz band) will be reflected within a future

### 5.2 Test Procedure

Please refer to ETSI EN 303 417 subclause 6.2.2

### 5.3 Summary of Test Results/Plots

➤ Pre-scan EUT X,Y,Z axis, and find the worst case at X axis.

TM1

Frequency (MHz)	Level (dBuA/m)@3m	C <sub>3</sub> Factor (dB)	Level (dBuA/m)@10m	Limit (dBuA/m)@10m	Result
0.1253	28.94	31.2	-2.26	65.78	PASS

TM2

Frequency (MHz)	Level (dBuA/m)@3m	C <sub>3</sub> Factor (dB)	Level (dBuA/m)@10m	Limit (dBuA/m)@10m	Result
0.1232	39.21	31.2	8.01	65.85	PASS

Note 1:  $H_{3m} = H_{10m} + C_3$  refer to ETSI EN300 330 Annex H.2

# WALTEK

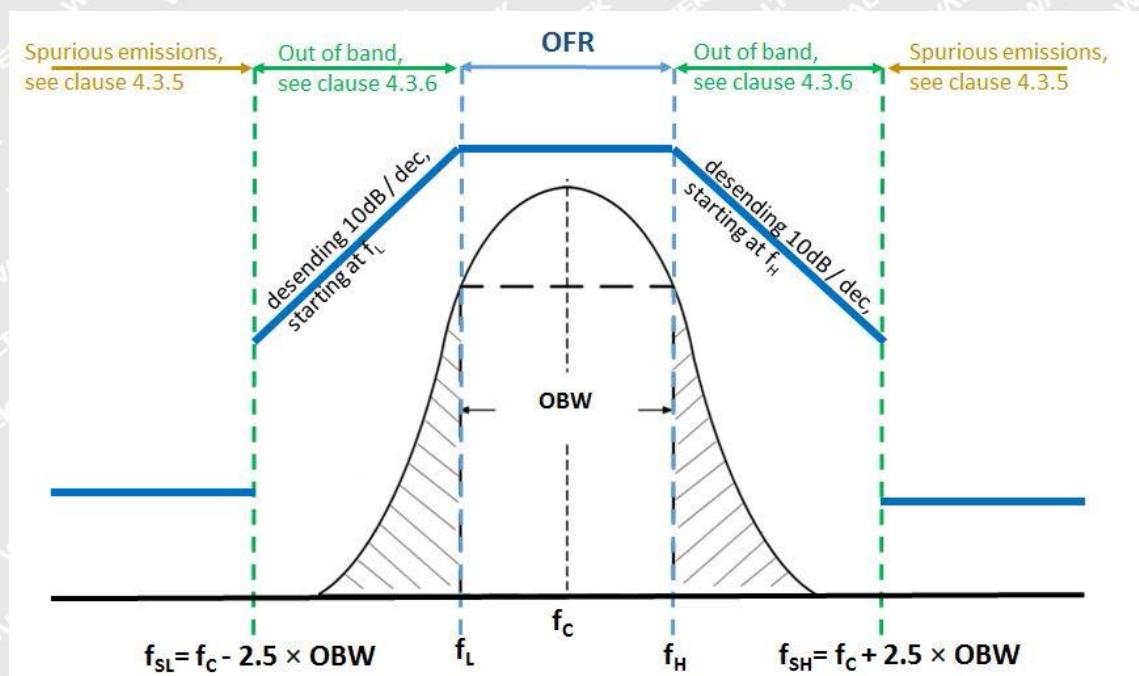

## 6. Transmitter spurious emissions

### 6.1 Standard Applicable

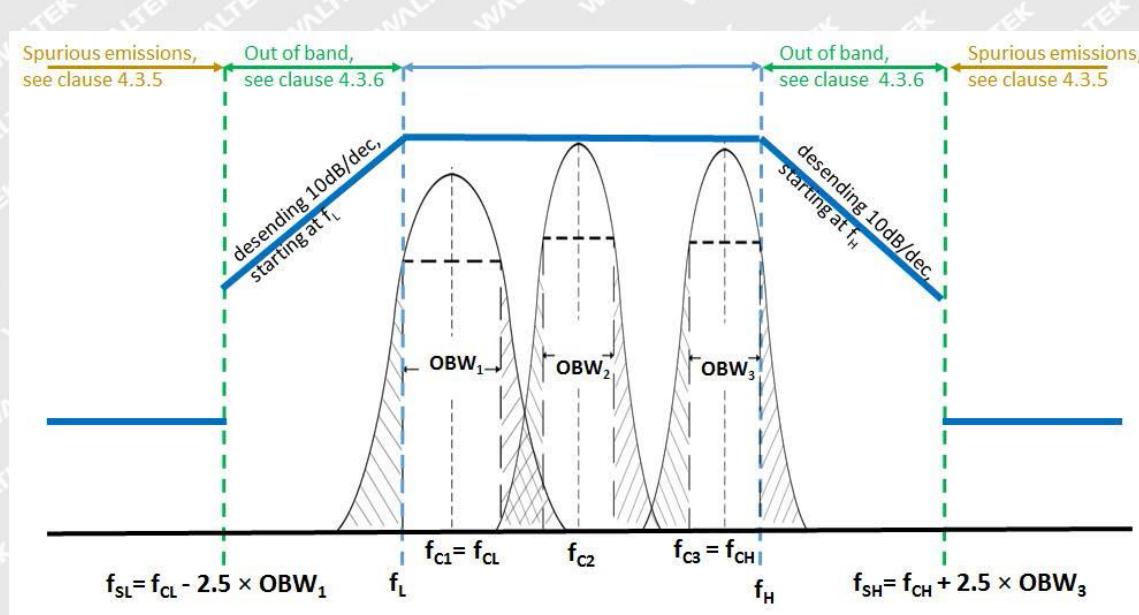

The transmitter spurious emissions for a single frequency system are to be considered in frequency ranges defined in Figure 4 ( $f < f_{SL}$  and  $f > f_{SH}$ ).

Figure 4: Out of band and spurious domain of a single frequency WPT system.

The transmitter spurious emissions for a multi frequency system (within one WPT frequency range from Table 2) are to be considered in frequency ranges defined in Figure 5 ( $f < f_{SL}$  and  $f > f_{SH}$ ).

Figure 5: Out of band and spurious domain of a multi - frequency system (during one WPT system cycle time).

**Limit**

The radiated field strength of spurious emissions below 30MHz shall not exceed the generated H-field given in Table 4.

<b>State (see note)</b>	<b>Frequency 9kHz ≤ f &lt; 10MHz</b>	<b>Frequency 10MHz ≤ f &lt; 30MHz</b>
Operating	27dB $\mu$ A/m at 9kHz descending 10dB/dec	-3.5dB $\mu$ A/m
Standby	5.5dB $\mu$ A/m at 9kHz descending 10dB/dec	-25dB $\mu$ A/m

NOTE: "Operating" means mode 2, 3 and 4 according to Table 2; "standby" means mode 1 according to Table

The power of any radiated spurious emission between 30MHz and 1GHz shall not exceed the values given in Table 5.

<b>State (see note)</b>	<b>47MHz to 74MHz 87.5MHz to 118MHz 174MHz to 230MHz 470MHz to 790MHz</b>	<b>Other frequencies between 30MHz to 1 000MHz</b>
Operating	4nW	250nW
Standby	2nW	2nW

NOTE:"Operating" means mode 2, 3 and 4 according to Table 2; "standby" means mode 1 according to Table

## 6.2 Test Procedure

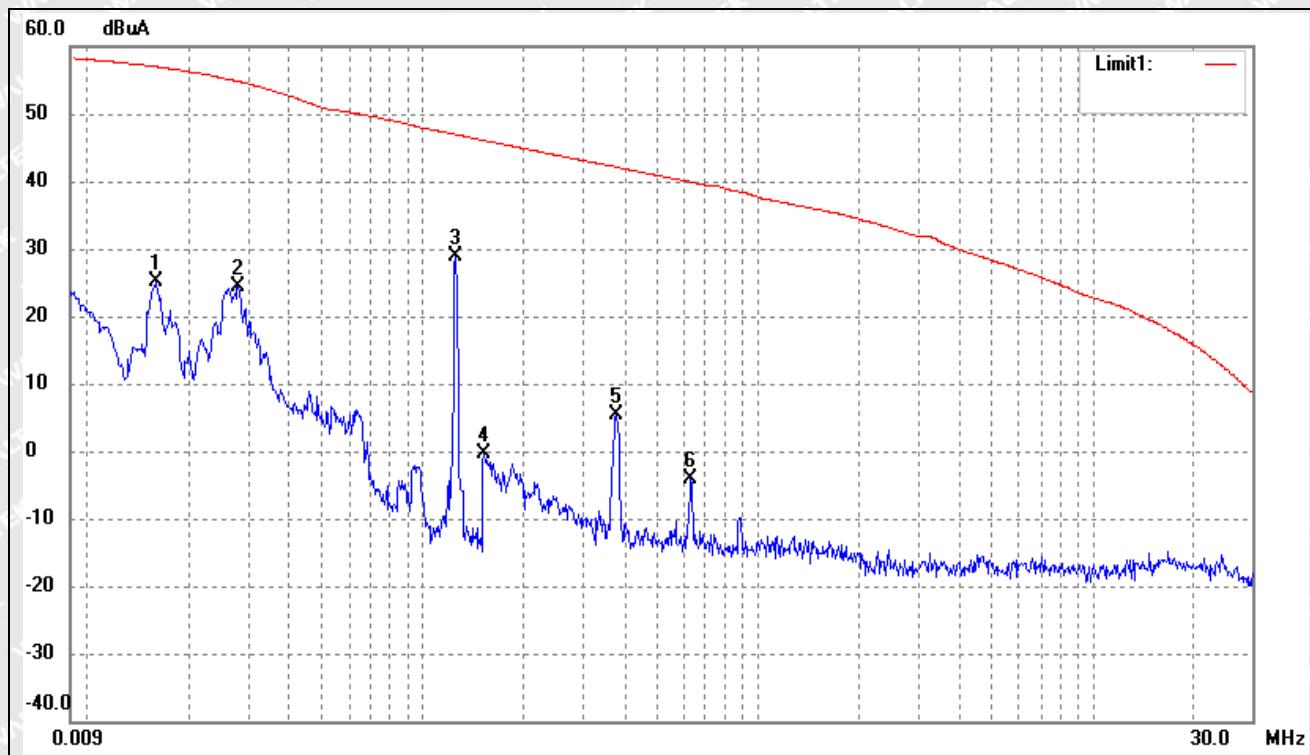

Please refer to ETSI EN 303 417 subclause 6.2.2 and subclause 6.2.3 for the measurement method.

## 6.3 Summary of Test Results/Plots

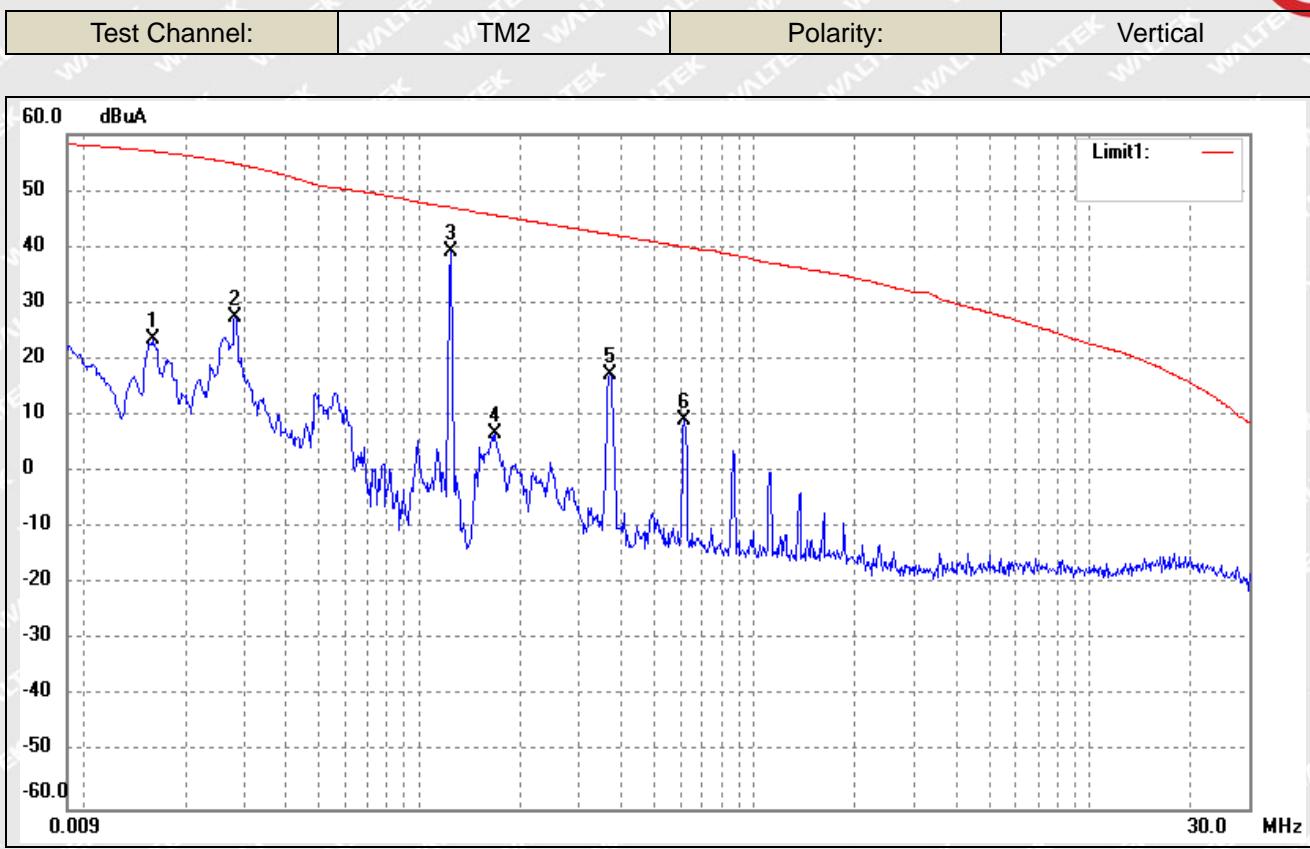

- Pre-scan EUT X,Y,Z axis, and find the worst case at X axis.
- 9kHz-30MHz Emission @3m

Test Channel:	TM1	Polarity:	Vertical
---------------	-----	-----------	----------

Note1: Standby mode dose not produce any emission, which no emission been detected.

## 7. Transmitter out of band (OOB) emissions

### 7.1 Standard Applicable

The WPT system out of band emissions are to be considered in frequency ranges defined in Figure 4 and Figure 5 (between  $f_{SL}$  and  $f_L$  and between  $f_H$  and  $f_{SH}$ ).

#### Limit

The OOB limits are visualized in Figures 4 and 5; they are descending from the intentional limits from Table 3 at  $f_H/f_L$  with 10 dB/decade.

### 7.2 Test Procedure

Please refer to ETSI EN 303 417 subclause 6.2.2 for the measurement method

### 7.3 Summary of Test Results/Plots

TM1

No.	Frequency (MHz)	Result@3m (dBuA/m)	$C_3$ (dB)	Result@10 (dBuA/m)	Limit@10 (dBuA/m)	Margin (dB)	Remark
1	$F_{cl}-2.5 \times OBW_1$	2.47	31.2	-28.73	65.95	-94.68	peak
2	$F_L$	10.95	31.2	-20.25	65.90	-86.15	peak
3	$F_H$	9.86	31.2	-21.34	65.87	-87.21	peak
4	$F_{ch}+2.5 \times OBW_3$	1.69	31.2	-29.51	65.82	-95.33	peak

TM2

No.	Frequency (MHz)	Result@3m (dBuA/m)	$C_3$ (dB)	Result@10 (dBuA/m)	Limit@10 (dBuA/m)	Margin (dB)	Remark
1	$F_{cl}-2.5 \times OBW_1$	6.03	31.2	-25.17	65.80	-90.97	peak
2	$F_L$	13.24	31.2	-17.96	65.75	-83.71	peak
3	$F_H$	12.86	31.2	-18.34	65.72	-84.06	peak
4	$F_{ch}+2.5 \times OBW_3$	5.72	31.2	-25.48	65.67	-91.15	peak

Note 1:  $H_{3m}=H_{10m}+C_3$  refer to ETSI EN300 330 Annex H.2

## 8. Receiver blocking

### 8.1 Standard Applicable

This requirement applies to all WPT systems operation in Mode 1, Mode 2 and Mode 3.

Blocking is a measure of the capability of the receiver to receive a wanted signal without exceeding a given degradation due to the presence of an unwanted input signal at any frequencies other than those of the receiver spurious responses.

The test shall be performed in the relevant operational modes (see clause 4.2.3).

The wanted performance criteria from clause 4.2.2 shall be used as criterion for the receiver blocking tests.

Limit

Table 6: Receiver blocking limits

	In-band signal	OOB signal	Remote-band signal
Frequency	Centre frequency ( $f_c$ ) of the WPT	$f = f_c \pm F$ (see note)	$f = fc \pm 10 \times F$ (see note)
Signal level field strength at the EUT	72dB $\mu$ A/m	72dB $\mu$ A/m	82dB $\mu$ A/m

NOTE:  $F = OFR$  see clause 4.3.3.

The EUT shall achieve the wanted performance criterion, see clause 4.2.2, in the presence of the blocking signal.

### 8.2 Test Procedure

Please refer to ETSI EN 303 417 Sub-clause 6.2.3 for the measurement method

### 8.3 Summary of Test Results/Plots

Not applicable

## 1. GENERAL INFORMATION

---

### 1.1 Product Description for Equipment Under Test (EUT)

<b>General Description of EUT</b>	
Product Name:	wireless power bank speaker
Trade Name:	/
Model No.:	MO6887
Adding Model(s):	/
Rated Voltage:	Battery DC 3.7V
Battery Capacity:	4000mAh
Adapter Model:	/
Software Version:	V1.0
Hardware Version:	V1.2
<i>Note: The test data is gathered from a production sample, provided by the manufacturer.</i>	

<b>Technical Characteristics of EUT</b>	
<b>Bluetooth</b>	
Bluetooth Version:	Bluetooth V5.1(EDR Mode)
Frequency Range:	2402-2480MHz
Max.RF Output Power:	0.93dBm (EIRP)
Type of Modulation:	GFSK, π/4 DQPSK, 8DPSK
Data Rate:	1Mbps, 2Mbps, 3Mbps
Quantity of Channels	79
Channel Separation:	1MHz
Type of Antenna:	PCB Antenna
Antenna Gain:	-0.58dBi
<b>EN 303417</b>	
Frequency Range:	100-205kHz
Radiated H-Field:	39.21dBuA/m(@3m)
Type of Antenna:	Coil Antenna
<i>Note: The Antenna Gain is provided by the customer and can affect the validity of results.</i>	

## 1.2 Compliance Standards

The tests were performed according to following standards:

**EN 50663:2017:** Generic standard for assessment of low power electronic and electrical equipment related to human exposure to electromagnetic fields (10MHz to 300GHz).

**EN 62479:2010:** Assessment of the compliance of low power electronic and electrical equipment with the basic restrictions related to human exposure to electromagnetic fields (10MHz to 300GHz).

**Maintenance of compliance** is the responsibility of the manufacturer. Any modification of the product maybe which result in lowering the emission/immunity should be checked to ensure compliance has been maintained.

## 1.3 Test Methodology

All measurements contained in this report were conducted with EN 50663,

The equipment under test (EUT) was configured to measure its highest possible emission level. For more detail refer to the Operating Instructions.

## 1.4 Test Facility

### Address of the test laboratory

Laboratory: Waltek Testing Group (Shenzhen) Co., Ltd.

Address: 1/F., Room 101, Building 1, Hongwei Industrial Park, Liuxian 2nd Road, Block 70 Bao'an District, Shenzhen, Guangdong, China

### FCC – Registration No.: 125990

Waltek Testing Group (Shenzhen) Co., Ltd. EMC Laboratory has been registered and fully described in a report filed with the FCC (Federal Communications Commission). The acceptance letter from the FCC is maintained in our files. The Designation Number is CN5010, and Test Firm Registration Number is 125990.

### Industry Canada (IC) Registration No.: 11464A

The 3m Semi-anechoic chamber of Waltek Testing Group (Shenzhen) Co., Ltd. has been registered by Certification and Engineering Bureau of Industry Canada for radio equipment testing with Registration No.: 11464A.

## 2. RF EXPOSURE BASIC RESTRICTIONS

### 2.1 Standard Applicable

Equipment complying with the requirements for the general public is deemed to comply with the requirements for workers without further testing.

The conformity assessment to demonstrate equipment compliance shall be made according to EN 62479:2010, 4.1 and Clause 6.

If routes B, C or D of 4.1 of EN 62479:2010 are followed then the values of  $P_{max}$ , as described in 4.2 of EN 62479:2010 and given in Annex A of EN 62479:2010, shall be replaced by those in Table 1 below.

Table 1 — Values of  $P_{max}$

Exposure tier	Region of body	$P_{max}$ (mW)
General public	Head and trunk	20
	Limbs	40
Workers	Head and trunk	100
	Limbs	200

### 2.2 Evaluation Results

#### Maximum Average Output Power

Modulation/ Frequency (MHz)	ERP/EIRP	ERP/EIRP	Limit	Result
	dBm	mW	mW	Pass/Fail
BR/EDR				
GFSK	-2.11	0.6152	20	Pass
$\pi/4$ DQPSK	-1.33	0.7362	20	Pass
8DPSK	0.93	1.2388	20	Pass

Frequency	Radiated H-Field	Radiated H-Field	Limit	Result
MHz	dBuA/m	A/m	A/m	Pass/Fail
100-205	39.21	0.00009131	5	Pass

Since average output power at worse case is: 1.2388mW which cannot exceed the exempt condition, 20mW specified in EN 50663. Correspondence between this European standard and Article 3 of Directive 2014/53/EU [2014 OJ L153]
